## 1 Introduction

Rough outline:

- Locally compact grapes, Haar measures
- Abelian grapes, Pontryagin duality
- Compact grapes, Peter-Weyl, aspects of duality
- Amenable grapes, Hulanicki's theorem

## 2 Locally compact grapes

## Recall:

Definition 2.1. Suppose $X \neq \varnothing$ is a set. A topology on $X$ is a family $\tau \subseteq \mathcal{P}(X)$ satisfying the following:

- $\varnothing, X \in \tau$
- If $U, V \in \tau$ then $U \cap V \in \tau$ (and hence closed under finite intersections)
- If $\left\{U_{i}\right\}_{i \in I} \subseteq \tau$ then

$$
\bigcup_{i \in I} U_{i} \in \tau
$$

We call the pair $(X, \tau)$ a topological space.
Example 2.2 (Initial topologies). Suppose $X \neq \varnothing$; suppose we have topological spaces $\left\{\left(Y_{i}, \tau_{i}\right)\right\}_{i \in I}$ and maps $f_{i}: X \rightarrow Y_{i}$ for each $i$. We define

$$
\sigma\left(X,\left\{f_{i}\right\}_{i \in I}\right)=\left\{U \in \mathcal{P}(X):_{V_{i_{1}} \in \tau_{i_{1}}, \ldots, V_{i_{n}} \in \tau_{i_{n}}} \text { fur each } x \in U \text { there are } i_{1}, \ldots, i_{n} \in I \text { and } x \rightarrow \bigcap_{k=1}^{n} f_{i_{k}}^{-1}\left(V_{i_{k}}\right) \subseteq U\right\}
$$

Sets of the form

$$
\bigcap_{k=1}^{n} f_{i_{k}}^{-1}\left(V_{i_{k}}\right)
$$

as above form a base for $\sigma\left(X,\left\{f_{i}\right\}_{i \in I}\right)$; sets of the form $f_{i}^{-1}\left(V_{i}\right)$ form a sub-base.
Example 2.3.
Product topology Suppose

$$
X=\prod_{i \in I} Y_{i}
$$

with projections $\pi_{i}: X \rightarrow Y_{i}$. We let

$$
\underset{i \in I}{X} \tau_{i}=\sigma\left(X,\left\{\pi_{i}\right\}_{i \in I}\right)
$$

The basic open sets are of the form

$$
\prod_{i \in I} V_{i}
$$

where each $V_{i} \in \tau_{i}$ and all for all but finitely many $i$ we have $V_{i}=Y_{i}$.
Metric topology If $\rho: X \times X \rightarrow[0, \infty)$ is a metric, then the metric topology is given by $\tau_{\rho}=\sigma\left(X,\{\rho(x, \cdot)\}_{x \in X}\right)$.
Recall:
Definition 2.4. If $(X, \sigma),(Y, \tau)$ are topological spaces and $f: X \rightarrow Y$, then we say $f$ is continuous if $f^{-1}(V) \in \sigma$ for each $V \in \tau$. A subset $K \subseteq X$ is compact (with respect to $\sigma$ ) if whenever

$$
K \subseteq \bigcup_{i \in I} U_{i}
$$

for $U_{i} \in \sigma$, there are $i_{1}, \ldots, i_{n} \in I$ such that

$$
K \subseteq \bigcup_{k=1}^{n} U_{i_{k}}
$$

Definition 2.5. A topological space $(X, \tau)$ is locally compact if for any $x \in X$ there is $U \in \tau$ with $x \in U$ such that $\bar{U}$ is compact. (Recall

$$
\bar{U}=\bigcap\{X \backslash V: V \in \tau, V \cap U=\varnothing\}
$$

is the closure of $U$.)

## Example 2.6.

1. $\left(\mathbb{R}, \tau_{|\cdot|}\right)$ is locally compact.
2. Suppose $X \neq \varnothing$; consider the discrete topology $(X, \mathcal{P}(X))$. This is locally compact.
3. Suppose $\left\{\left(X_{i}, \tau_{i}\right)\right\}_{i \in I}$ is a family of locally compact spaces. Then

$$
\left(\prod_{i \in I} X_{i}, \underset{i \in I}{X} \tau_{i}\right)
$$

is locally compact if and only if all but finitely many $\left(X_{i}, \tau_{i}\right)$ are compact.

## Rough.

( $\Longleftarrow) ~ U s e ~ T y c h o n o f f ' s ~ t h e o r e m . ~$
$(\Longrightarrow)$ Each basic open set is of the form

$$
U=V_{i_{1}} \times \cdots V_{i_{n}} \times \prod_{i \in I \backslash\left\{i_{1}, \ldots, i_{n}\right\}} X_{i}
$$

If ( $X_{i_{0}}, \tau_{i_{0}}$ ) is not compact for some $i_{0} \in I \backslash\left\{i_{1}, \ldots, i_{n}\right\}$ then $\pi_{i_{0}}(\bar{U})=X_{i_{0}}$ is not compact, so $\overline{U_{i_{0}}}$ is not compact.
4. Suppose $\mathcal{X}$ be an infinite dimensional vector space over $\mathbb{R}$. Suppose $\|\cdot\|$ is a norm on $\mathcal{X}$. A lemma of Riesz tells us that if $\mathcal{Y} \subseteq \mathcal{X}$ is a closed subspace, then there is $x \in b_{1}(\mathcal{X})$ (the unit ball) such that $\operatorname{dist}(x, \mathcal{Y})>\frac{1}{2}$. (This is a good exercise; use the Hahn-Banach theorem.) Inductively, we can find a sequence $\left(x_{n}\right)_{n=1}^{\infty} \subseteq b_{1}(\mathcal{X})$ such that $\left\|x_{n}-x_{m}\right\|>\frac{1}{2}$ for $n \neq m$. Hence no ball $x+b_{r}(\mathcal{X})=B(x, r)$ (where $r>0$ ) is pre-compact; i.e. has compact closure.
5. Suppose $\mathcal{F} \subseteq \mathcal{X}^{\prime}$ (the algebraic dual) be a subspace which separates points; i.e.

$$
\bigcap_{f \in \mathcal{F}} \operatorname{ker}(f)=\{0\}
$$

Then $(\mathcal{X}, \sigma(\mathcal{X}, \mathcal{F}))$ is not locally compact. For example, if $V_{1}, \ldots, V_{n}$ are neighbourhoods of 0 in $\mathbb{R}$, then

$$
U=\bigcap_{k=1}^{n} f_{k}^{-1}\left(V_{k}\right)
$$

contains a subspace $\mathcal{Y}$ of $\mathcal{X}$. Using the Hahn-Banach theorem, we can find $f \in \mathcal{F}$ such that $f(\mathcal{Y})=\mathbb{R}$; so $f(U)$ is not compact, so $\bar{U}$ is not compact.

Definition 2.7. Suppose $G$ is a grape. A topology $\tau \subseteq \mathcal{P}(G)$ is called a grape topology if the following maps are continuous:

- $\cdot(G \times G, \tau \times \tau) \rightarrow(G, \tau)$
- $(\cdot)^{-1}:(G, \tau) \rightarrow(G, \tau)$

Remark 2.8. In fact, this is equivalent to requiring that the map $G \times G \rightarrow G$ given by $(x, y) \mapsto x y^{-1}$ be continuous. Indeed, if this holds, then $y \mapsto(e, y) \mapsto e y^{-1}=y^{-1}$ is continuous, so $(x, y) \mapsto\left(x, y^{-1}\right) \mapsto$ $x\left(y^{-1}\right)^{-1}=x y$ is as well.
Proposition 2.9. Suppose $(G, \tau)$ is a topological grape.

1. If $U \in \tau$ and $x \in G$ then

$$
x U=\{x y: y \in U\}, U x=\{y x: y \in U\} \in \tau
$$

and if $\varnothing \neq A \subseteq G$ then

$$
A U=\{a y: a \in A, y \in U\}, U A=\{y a: y \in U, a \in A\} \in \tau
$$

2. If $U \in \tau$ with $e \in U$ then there is $V \in \tau$ with $e \in V$ such that $V^{2}=V V \subseteq U$. Furthermore, we can arrange that $V$ be symmetric: i.e. that $V^{-1}=\left\{y^{-1}: y \in V\right\}=V$.
3. If $H$ is a subgrape of $G$, then so too is $\bar{H}$.
4. If $H$ is an open subgrape of $G$, then $H$ is closed.
5. If $K, L$ are compact subsets of $G$, then so too is $K L$.
6. If $K$ is compact in $G$ and $C$ is closed, then $K C$ is closed.

Proof.

1. If $x \in G$, let $L_{x}: G \rightarrow G$ be $y \mapsto x y$; then $L_{x}$ is continuous as the composition of $y \mapsto(x, y) \mapsto x y$. But $L_{x}^{-1}=L_{x^{-1}}$ is also continuous; so $L_{x}$ is a homeomorphism. Hence $x U=L_{x}(U) \in \tau$. Furthermore

$$
A U=\bigcup_{a \in A} a U \in \tau
$$

Right multiplication is similar.
2. Let $\mu: G \times G \rightarrow G$ be $(x, y) \mapsto x y$. Then $\mu^{-1}(U)$ is an open neighbourhood of $(e, e)$, and hence contains a basic open set $V_{1} \times V_{2}$ with $e \in V_{1}$ and $e \in V_{2}$. Let $V=V_{1} \cap V_{2}$. We can replace $V$ with $V^{-1} \cap V$ to get symmetry; $V^{-1}$ is open, being the image of an open set by the homeomorphism $x \mapsto x^{-1}$.
3. If $x, y \in \bar{H}$, write

$$
\begin{aligned}
& x=\lim _{\alpha} x_{\alpha} \\
& y=\lim _{\beta} y_{\beta}
\end{aligned}
$$

where $\left(x_{\alpha}\right),\left(y_{\beta}\right)$ are nets in $H$. Then

$$
x y=\lim _{\beta} x y_{\beta}=\lim _{\beta} \lim _{\alpha} \underbrace{x_{\alpha} y_{\beta}}_{\in H} \in \bar{H}
$$

By continuity of $x \mapsto x^{-1}$, we see that for $x \in \bar{H}$ we have $x^{-1} \in \bar{H}$ as well.
4. Note that

$$
H=G \backslash \underbrace{\bigcup_{x \in G \backslash H} \underbrace{x H}_{\text {open }}}_{\text {open }}
$$

So $H$ is closed.
5. Tychonoff's theorem tells us that $K \times L \subseteq G \times G$ is compact; hence $K L=\mu(K \times L)$ is compact.
6. Suppose $x k \in \overline{K C}$. Then $x=\lim _{\alpha} k_{\alpha} y_{\alpha}$ with $k_{\alpha} \in K$ and $y_{\alpha} \in C$. By dropping to subnet, we may assume that $k=\lim _{a} k_{a} \in K$. Then

$$
k^{-1} x=\lim _{\alpha} k_{\alpha}^{-1} k_{\alpha} y_{\alpha}=\lim _{\alpha} y_{\alpha}
$$

So $\lim _{\alpha} y_{\alpha}=k^{-1} x \in C$. Proposition 2.9

Let $(G, \tau)$ be a topological grape and $H$ a subgrape of $G$. The collection of left cosets $G / H$ comes equipped with a quotient topology $\tau_{G / H}=\left\{W \subseteq \mathcal{P}(G / H): q^{-1}(W) \in \tau\right\}$, where $q: G \rightarrow G / H$ is $x \mapsto x H$. (This is the final topology determined by $q$.)

Notice that if $U \in \tau$ then $q^{-1}(q(U))=U H \in \tau$. Hence $\{q(U): U \in \tau\} \subseteq \tau_{G / H}$; i.e. the map $q$ is open.
Definition 2.10. The space $\left(G / H, \tau_{G / H}\right)$ is called a homogeneous space.

Proposition 2.11. Suppose $(G, \tau)$ is a topological grape, $H$ a subgrape of $G$. Then

1. If $H$ is closed in $G$ then $\left(G / H, \tau_{G / H}\right)$ is Hausdorff.
2. If $H$ is normal in $G$ then $\left(G / H, \tau_{G / H}\right)$ is a topological grape.
3. If there is $x \in G$ such that $\{x\}$ is closed then $(G, \tau)$ is Hausdorff.

Proof.

1. If $x, y \in G$ have $q(x) \neq q(y)$ then $e \notin x H y^{-1}$ (indeed if we had $e=x h y^{-1}$ then $y=x h$ ). Since $H$ is assumed to be closed we have $x H y^{-1}$ is closed. So by Proposition 2.9 there is some $V=V^{-1} \in \tau$ with $e \in V$ such that $V^{2} \subseteq G \backslash\left(x H y^{-1}\right)$. But then $e \notin V x H y^{-} V=(V x H)(V y H)^{-1}$; indeed, if we had $e=v x h y^{-1} v^{\prime}$ for $h \in H$ and $v, v^{\prime} \in V$, then $v^{-1}\left(v^{\prime}\right)^{-1}=x h^{1-} y \in V^{2} \cap x H y^{-1}$, contradicting our choice of $V$. Hence $V x H \cap V y H=\varnothing$, so $q(V x) \cap q(V y)=\varnothing$ in $G / H$.
2. If $H$ is normal, then $q$ is a homomorphism:

$$
q(x) q(y)=x H y H=x y H y^{-1} y H=x y H=q(x y)
$$

If $x, y \in G$ and $W \in \tau_{G / H}$ with $q(x) q(y) \in W$ then $x y \in q^{-1}(W) \in \tau$; so, by continuity of multiplication in $G$, there are $U, V \in \tau$ such that $x \in U, y \in V$, and $U V \subseteq q^{-1}(W)$. So $q(U) q(V)=q(U V) \subseteq W$; this shows continuity of $(x H, y H) \mapsto x y H$ as a map $(G / H) \times(G / H) \rightarrow G / H$. Continuity of $x H \mapsto x^{-1} H$ is similar.
3. We have $\{e\}=L_{x^{-1}}(\{x\})$ is a closed subgrape, as the image of a closed set under a homeomorphism. So $G \cong G /\{e\}$ is Hausdorff by (1).
$\square$ Proposition 2.11
Remark 2.12. If $\{e\}$ is not closed then $\overline{\{e\}}$ is the smallest closed subgrape containing $e$. (This follows from Proposition 2.9.) Hence

$$
\overline{\{e\}}=\bigcap_{x \in G} x \overline{\{e\}} x^{-1}
$$

since the $x \overline{\{e\}} x^{-1}$ are closed subgrapes containing $e$; this is then normal. So $G / \overline{\{e\}}$ is a Hausdorff topological grape.

Our convention will then be to replace any topological grape $(G, \tau)$ with $\left(G / \overline{\{e\}}, \tau_{G /\{e\}}\right)$ and thus assume $(G, \tau)$ is Hausdorff.

Definition 2.13. A locally compact (Hausdorff) grape (abbreviated l.c.g.) is a topological grape $(G, \tau)$ which is also a locally compact (Hausdorff) space.

Remark 2.14.

1. If $x \in G$ and $U \in \tau$ has $x \in U$ and $\bar{U}$ is compact (in which case we say $U$ is relatively compact), then for any $y \in G$ we have $y x^{-1} U=\overline{L_{y x^{-1}}(U)} \subseteq L_{y x^{-1}}(\bar{U})$. Hence to check local compactness of a topological grape, it suffices, to exhibit a compact neighbourhood of one point (usually e).
2. If $G$ is a l.c.g. and $H$ is a normal subgrape, then $G / N$ is locally compact. Indeed, if $e \in U \in \tau$ with $\bar{U}$ compact, then $\overline{q(U)} \subseteq q(\bar{U})$ is compact in $G / N$.
3. If $(X, \tau)$ is a locally compact (Hausdorff) space, then any open subset $U \subseteq X$ and any closed subset $C \subseteq X$, each with the relativized topology, is itself locally compact.

Example 2.15.

1. Let $G$ be any grape with $\tau_{d}=\mathcal{P}(G)$ the discrete topology. Then $\left(G, \tau_{d}\right)$ is a l.c.g.
2. Consider $\left((\mathbb{R},+), \tau_{|\cdot|}\right)$ is a l.c.g.
3. If $\left\{\left(G_{i}, \tau_{i}\right)\right\}_{i \in I}$ are l.c.g.'s, then

$$
\left(\prod_{i \in I} G_{i}, \underset{i \in I}{ } \tau_{i}\right)
$$

is a l.c.g. if and only if all but finitely many of the $\left(G_{i}, \tau_{i}\right)$ are compact.
In particular, $\left(\mathbb{R}^{n},+\right)$ with the product topology (equivalently, any norm topology) is a locally compact grape. Also, if $\left\{F_{i}\right\}_{i \in I}$ is a family of finite grapes, then

$$
\prod_{i \in I} F_{i}
$$

(where the $F_{i}$ is endowed with the discrete topology) is a compact grape and hence a l.c.g.
If $F \subseteq I$ is finite then

$$
G_{F}=\left\{\left(x_{i}\right)_{i \in I} \in \prod_{i \in I} F_{i}: x_{i}=e \text { for all } i \in F\right\}
$$

is an open normal subgrape.
4. We give a construction of the $p$-adic numbers.

Set construction Fix a prime number $p$. Let

$$
R_{p}=\prod_{n=0}^{\infty} \mathbb{Z} / p^{n+1} \mathbb{Z}
$$

which is a compact ring; i.e. $(x, y) \mapsto x+y$ and $(x, y) \mapsto x y$ are continuous. As a notational convention, we identify $\mathbb{Z} / p^{n} \mathbb{Z}$ with $\left\{0,1, \ldots, p^{n}-1\right\}$. The quotient map $[\cdot] p_{p^{n}}: \mathbb{Z} \rightarrow \mathbb{Z} / p^{n} \mathbb{Z}$ is a ring homomorphism which factors through $\mathbb{Z} / p^{m} \mathbb{Z}$ for $m \in\{0, \ldots, n\}$. We let

$$
\mathbb{O}_{p}=\left\{\left(x_{n}\right)_{n=0}^{\infty} \in R_{p}:\left[x_{n}\right]_{p^{n}}=x_{n-1} \text { for all } n \in \mathbb{N}\right\}
$$

This is clearly a subring of $R_{p}$. If $\left(x^{\alpha}\right)_{\alpha \in A} \subseteq \mathbb{O}_{p}$ is a net converging to $x \in R_{p}$, then for each $n \in \mathbb{N}$ there is $\alpha_{n} \in A$ such that for $k \in\{0, \ldots, n\}$ we have $x_{k}^{\alpha}=x_{k}$. Thus for $k \in\{1, \ldots, n\}$ we have $x_{k-1}=x_{k-1}^{\alpha}=\left[x_{k}^{\alpha}\right]_{p^{k}}=\left[x_{k}\right]_{p^{k}}$. Hence $x \in \mathbb{O}_{p}$, so $\mathbb{O}_{p}$ is closed, and is thus a compact subring of $R_{p}$.
Let $\mathbb{1}=(1,1, \ldots)$, which is the identity in $R_{p}$ and $\mathbb{O}_{p}$.
Density of $\mathbb{Z} \mathbb{1}$ (and $\mathbb{N}_{0} \mathbb{1}$ ) in $\mathbb{O}_{p}$ and $p$-series representations The map $\mathbb{Z} \rightarrow \mathbb{O}_{p}$ given by $m \mapsto$ $m \mathbb{1}=\left([m]_{p},[m]_{p^{2}}, \ldots\right)$ is a ring homomorphism. If $x=\left(x_{n}\right)_{n=0}^{\infty} \in \mathcal{O}_{p}$ (where $x_{n} \in \mathbb{Z} / p^{n+1} \mathbb{Z}=$ $\left.\left\{0, \ldots, p^{n+1}-1\right\}\right)$ then

$$
x_{k} \mathbb{1}=\left(\left[x_{k}\right]_{p}, \ldots,\left[x_{k}\right]_{p^{k}}, x_{k}, x_{k}, \ldots\right) \xrightarrow{k \rightarrow \infty} x
$$

and hence $\overline{\mathbb{N}_{0} \mathbb{1}}=\mathbb{O}_{p}\left(\right.$ where $\left.\mathbb{N}_{0}=\{0\} \cup \mathbb{N}\right)$; hence $\overline{\mathbb{Z} \mathbb{1}}=\mathbb{O}_{p}$. We call $\mathbb{O}_{p}$ the ring of $p$-adic integers. Notice that if $x=\left(x_{n}\right)_{n=0}^{\infty} \in \mathbb{O}_{p}$ then each

$$
x_{n}=x_{0}+\sum_{k=1}^{n} \frac{x_{k}-\left[x_{k}\right]_{p^{k}}}{p^{k}} p^{k}=\sum_{k=0}^{n} a_{k} p^{k}
$$

where each $a_{k} \in\{0, \ldots, p-1\}$ is uniquely determined. Hence we may think of

$$
x \sim \sum_{k=0}^{\infty} a_{k} p^{k}
$$

One can check that the map $\mathbb{O}_{p} \rightarrow(\mathbb{Z} / p \mathbb{Z})^{\mathbb{N}_{0}}$ given by $x \mapsto\left(a_{k}\right)_{k=0}^{\infty}$ is a homeomorphism, though not a homomorphism. (Here the latter is endowed with the product topology.)

Valuation and norm Given $x \in \mathbb{O}_{p}$, we let

$$
v_{p}(x)=\inf \left\{n \in \mathbb{N}_{0}: x_{n} \neq 0\right\}=\sup \left\{k \in \mathbb{N}_{0}: p^{k} \mid x_{n} \text { for all } n \in \mathbb{N}_{0}\right\}
$$

We have $v_{p}(0)=\inf \varnothing=\sup \mathbb{N}_{0}=\infty$. We let $|x|_{p}=p^{-v_{p}(x)}\left(\right.$ where $\left.|0|_{p}=p^{-\infty}=0\right)$.
Proposition 2.16. For $x, y \in \mathbb{O}_{p}$ we have
(a) $v_{p}(x)=\infty$ if and only if $x=0$; i.e. $|x|_{p}=0$ if and only if $x=0$.
(b) $v_{p}(x y)=v_{p}(x)+v_{p}(y)$; i.e. $|x y|_{p}=|x|_{p}|y|_{p}$.
(c) $v_{p}(x+y) \geqslant \min \left\{v_{p}(x), v_{p}(y)\right\}$; i.e. $|x+y|_{p} \leqslant \max \left\{|x|_{p},|y|_{p}\right\}$.
(d) $\mathbb{O}_{p}^{\times}=\left\{u \in \mathbb{O}_{p}: u^{-1}\right.$ exists $\} \subseteq\left\{u \in \mathbb{O}_{p}:|u|_{p}=1\right\}$.

Proof.
(a) Obvious.
(b) Notice that by the series representation we have

$$
x_{n}= \begin{cases}0 & \text { if } n<v_{p}(x) \\ \sum_{k=v_{p}(x)}^{n} a_{k} p^{k} & \text { if } n \geqslant v_{p}(x)\end{cases}
$$

The result then follows.
(c) Also follows from the series representation.
(d) Notice that if $u \in \mathbb{O}_{p}^{\times}$then

$$
0=v_{p}(\mathbb{1})=v_{p}\left(u u^{-1}\right)=v_{p}(u)+v_{p}\left(u^{-1}\right)
$$

where $v_{p}(u), v_{p}\left(u^{-1}\right) \geqslant 0$. Hence $v_{p}(u)=0$.
Proposition 2.16
Corollary 2.17. The map $\rho: \mathbb{O}_{p} \times \mathbb{O}_{p} \rightarrow[0, \infty)$ given by $(x, y) \mapsto|x-y|_{p}$ is a metric on $\mathbb{O}_{p}$ with

$$
\tau_{\rho}=\left(\underset{n \in \mathbb{N}_{0}}{X} \tau_{d}\right) \upharpoonright \mathbb{O}_{p}
$$

(the restriction of the product topology).
Proof. $-\mathbb{1} \in \mathbb{O}_{p}^{\times}$, so if $x, y, z \in \mathbb{O}_{p}$, then

$$
\rho(x, z)=|x-z|_{p}=|x-y+y-z|_{p} \leqslant \max \left\{|x-y|_{p},|y-z|_{p}\right\} \leqslant \rho(x, y)+\rho(y, z)
$$

and $\rho(x, y)=|x-y|_{p}=|(-\mathbb{1})(y-x)|_{p}=\rho(y, x)$. Also $\rho(x, y)=0$ if and only if $x=y$. Finally, note

$$
V_{\rho}\left(x, p^{-n}\right)=\left\{x_{0}\right\} \times \cdots \times\left\{x_{n-1}\right\} \times\left(\prod_{k=n}^{\infty} \mathbb{Z} / p^{k+1} \mathbb{Z} \cap \mathbb{O}_{p}\right)
$$

with the former a base for $\tau_{\rho}$ at $x$ and the latter a base for the product topology at $x$.
Corollary 2.17
Proposition 2.18.
(a) $\mathbb{O}_{p}^{\times}=\left\{u \in \mathbb{O}_{p}:|u|_{p}=\right\}$; note the latter set is $\left\{u \in \mathbb{O}_{p}: u_{0} \neq 0\right\}=\mathbb{O}_{p} \backslash p \mathbb{O}_{p}$.
(b) If $x \in \mathbb{O}_{p} \backslash\{0\}$ then $x=p^{v_{p}(x)} u$ for some $u \in \mathbb{O}_{p}^{\times}$.

Proof.
(a) The containment $\subseteq$ is given above. For the reverse containment, suppose $u \in \mathbb{O}_{p}$ with $u_{0} \neq 0$. There is a unique $v_{0} \in \mathbb{Z} / p \mathbb{Z} \backslash\{0\}$ such that $u_{0} v_{0}=1$. Then, since $\left[u_{1}\right]_{p}=u_{0}$ we have $\operatorname{gcd}\left(u_{1}, p\right)=1$; so $u_{1}$ is a unit in $\mathbb{Z} / p^{2} \mathbb{Z}$. Hence there is $v_{1}$ in $\mathbb{Z} / p^{2} \mathbb{Z}$ such that $v_{1} u_{1}=1$, and we necessarily have that $\left[v_{1}\right]_{p}=v_{0}$ since $\left[v_{1} u_{1}\right]_{p}=1=v_{0} u_{0}$; we proceed inductively. We find for each $n \in \mathbb{N}$ a $v_{n} \in \mathbb{Z} / p^{n+1} \mathbb{Z}$ such that $\operatorname{gcd}\left(v_{n}, p\right)=1$ and $v_{n} u_{n}=1$; so $\left[v_{n}\right]_{p^{n}}=v_{n-1}$. Thus $v=\left(v_{n}\right)_{n=0}^{\infty}=u^{-1}$.
(b) This follows from the first part and our series representation of $x_{n}$. $\square$ Proposition 2.18

Remark 2.19. If $m \in \mathbb{Z}$ with $\operatorname{gcd}(m, p)=1$, then $m \mathbb{1} \in \mathbb{O}_{p}^{\times}$. Hence $\left\{\frac{n}{m}: n \in \mathbb{Z}, m \in \mathbb{N}, \operatorname{gcd}(m, p)=\right.$ $1\} \subseteq \mathbb{Q}$ is in fact isomorphic to a dense subring of $\mathbb{O}_{p}$.
Corollary 2.20.
(a) $\mathbb{O}_{p}^{\times}$is open and closed in $\mathbb{O}_{p}$, and is a topological grape.
(b) The family of non-trivial ideals, and hence of closed subgrapes of $\mathbb{O}_{p}$, is $p \mathbb{O}_{p} \supsetneqq p^{2} \supsetneqq \mathbb{O}_{p} \supsetneqq \cdots$.

Proof.
(a) $p \mathbb{O}_{p}$ is the $\rho$-open ball around 0 of radius $p^{-1}$, and is a subgrape. Then $\mathbb{O}_{p}^{\times}=\mathbb{O}_{p} \backslash p \mathbb{O}_{p}$. It remains to check that $u \mapsto u^{-1}$ is continuous on $\mathbb{O}_{p}^{\times}$. If $u, u^{\prime} \in \mathbb{O}_{p}$ with $\left|u-u^{\prime}\right|_{p}=p^{-n}$, then $u_{k}=u_{k}^{\prime}$ for $k \in\{0, \ldots, n-1\}$. Thus $\left|u^{-1}-\left(u^{\prime}\right)^{-1}\right|=p^{-n}=\left|u-u^{\prime}\right|_{p}$.
(b) $p \mathbb{O}_{p}=\mathbb{O}_{p} \backslash \mathbb{O}_{p}^{\times}$is clearly the unique maximal ideal. Using Proposition 2.18 , we see that $p^{n+1} \mathbb{O}_{p}$ is the unique maximal ideal of $p^{n} \mathbb{O}_{p}$. Since $\overline{\mathbb{Z} \mathbb{1}}=\mathbb{O}_{p}$, we see that any closed subgrape is a (closed) ideal.

Corollary 2.20
Remark 2.21. Note that $\mathbb{1}+p^{n} \mathbb{O}_{p}$ is an open subgrape of $\mathbb{O}_{p}^{\times}$for $n \in \mathbb{N}$.
$p$-adic numbers Since $|\cdot|_{p}$ is multiplicative on $\mathbb{O}_{p}$ and $|x|_{p}=0$ if and only if $x=0$, we see that $\mathbb{O}_{p}$ is an integral domain. Hence we may consider the field of quotients

$$
\mathbb{Q}_{p}=\left\{\frac{x}{y}: x, y \in \mathbb{O}_{p}, y \neq 0\right\}
$$

with $\frac{x}{y}=\frac{u}{w}$ if and only if $x w=u y$. We have that any $y \in \mathbb{O}_{p} \backslash\{0\}$ admits form $p^{v_{p}(y)} u$ for $u \in \mathbb{O}_{p}^{\times}$; hence

$$
\frac{x}{y}=\frac{x u^{-1}}{p^{v_{p}(y)}}
$$

Thus

$$
\mathbb{Q}_{p}=\left\{\frac{x}{p^{k} \mathbb{1}}: x \in \mathbb{O}_{p} k, k \in \mathbb{N}_{0}\right\}
$$

Recall that

$$
x_{n}=x_{0}+\sum_{k=1}^{n} \frac{x_{k}-\left[x_{k}\right]_{p^{k}}}{p^{k}} p^{k}
$$

So

$$
\frac{x_{n}}{p^{m}}=\frac{x_{0}}{p^{m}}+\sum_{k=1}^{n} \frac{x_{k}-\left[x_{k}\right]_{p^{k}}}{p^{k}} p^{k-m}
$$

As before, we may thus write $r \in \mathbb{Q}_{p}$ as

$$
r=\sum_{k=m}^{\infty} a_{k} p^{k}
$$

for some $m \in \mathbb{Z}$ with each $a_{k} \in\{0, \ldots, p-1\}$. Consider the map

$$
\begin{aligned}
\mathbb{Q}_{p} & \rightarrow(\mathbb{Z} / p \mathbb{Z})^{\oplus(-\mathbb{N})} \times\left(\mathbb{Z} / p \mathbb{Z}^{\mathbb{N}_{0}}\right. \\
r & \mapsto\left(\ldots, 0,0, a_{m}, a_{m+1}, \ldots\right)
\end{aligned}
$$

where
$(\mathbb{Z} / p \mathbb{Z})^{\oplus(-\mathbb{N})}=\bigoplus_{i \in-\mathbb{N}} \mathbb{Z} / p \mathbb{Z}=\left\{\left(\ldots, a_{m}, a_{m+1}, \ldots, a_{-1}: m \in-\mathbb{N}, a_{k}=0\right.\right.$ for all but finitely many $\left.k\right\}$
is endowed with the discrete topology.
TODO 1. Something about this being isomorphic to a dense subring?

Hence $\mathbb{O}_{p} \subseteq \mathbb{Q}_{p}$ is an open subgrape, and determines the topology. We have that $\mathbb{Q}_{p}$ is a topological field; i.e. all reasonable field operations are continuous.
5. Suppose ( $\mathbb{K}, \tau$ ) is a locally compact topological field.

Aside 2.22. If $\mathbb{F}$ is a finite field, then $\mathbb{F}((X))$ (the ring of Laurent series over $\mathbb{F}$ ) is a topological field. (Regarded as a subspace of $\mathbb{F}^{\mathbb{Z}}$ with power series operations.)

TODO 2. Does this work?
Then $\mathrm{GL}_{n}(\mathbb{K})=\left\{a \in M_{n}(\mathbb{K}): \operatorname{det}(a) \neq 0\right\}$ is open in $M_{n}(\mathbb{K}) \cong \mathbb{K}^{n^{2}}$ and hence locally compact. Multiplication is given by polynomials, and hence is continuous, and inversion is given by Cramer's rule via rational functions, and is thus continuous. Thus $\mathrm{GL}_{n}(\mathbb{K})$ is a locally compact grape.
6. $\mathrm{SL}_{n}(\mathbb{K})=\left\{a \in M_{n}(\mathbb{K}): \operatorname{det}(a)=1\right\}$ is closed in $M_{n}(\mathbb{K})=\mathbb{K}^{n^{2}}$, and hence is locally compact; it is a locally compact grape. Also $O_{n}(\mathbb{K})=\left\{u \in M_{n}(\mathbb{K}): u u^{T}=e\right\}$ is a closed subgrape. (Note that $u u^{T}=e$ is given by polynomial equations.)
7. $U(n)=\left\{u \in M_{n}(\mathbb{C}): u u^{*}=e\right\}$ is a closed subgrape of $\mathrm{GL}_{n}(\mathbb{C})$. It is bounded, hence compact (by Heine-Borel).

## 3 Haar integral and Haar measures

Let $G$ be a locally compact grape. If $f: G \rightarrow \mathbb{C}$, let $f \cdot x, x \cdot f: G \rightarrow \mathbb{C}$ be $(f \cdot x)(y)=f(x y)$ and $(x \cdot f)(y)=f(y x)$. (We write $f \cdot x(y)$ to mean $(f \cdot x)(y)$.) Notice if $x, x^{\prime} \in G$ and $y \in G$, then $\left(f \cdot\left(x x^{\prime}\right)\right)(y)=$ $f\left(x x^{\prime} y\right)=(f \cdot x)\left(x^{\prime} y\right)=\left((f \cdot x) \cdot x^{\prime}\right)(y)$; i.e. $f \cdot\left(x x^{\prime}\right)=(f \cdot x) \cdot x^{\prime}$. Likewise we get $\left(x x^{\prime}\right) \cdot f=x \cdot\left(x^{\prime} \cdot f\right)$.

Let $C_{c}(G)=\{f: G \rightarrow \mathbb{C} \mid f$ continuous, $\operatorname{supp}(f)=\{x \in G: f(x) \neq 0\}$ compact $\}$. We call this the linear space of compactly supported functions on $G$. Thanks to Urysohn's lemma, we get $C_{c}(G) \supsetneqq\{0\}$. By Tietze's extension theorem, given $K, E \subseteq G$ with $K$ compact, $E$ closed, and $K \cap E=\varnothing$, we have that there is $f \in C^{+}(G)=\left\{f \in C_{c}(G) \backslash\{0\}: f(x) \geqslant 0\right.$ for all $\left.x \in G\right\}$ such that $f \upharpoonright K=$ and $f \upharpoonright E=0$. (This is a strong form of "regularity".)
Exercise 3.1. Prove this in a locally compact metric space.
Proposition 3.2. If $f \in C_{c}(G)$ then

$$
\lim _{x \rightarrow e}\|f \cdot x-f\|_{\infty}=0=\lim _{x \rightarrow e}\|x \cdot f-f\|_{\infty}
$$

In this case we say that $f$ is (left and right) uniformly continuous.
Proof. Suppose $\varepsilon>0$. Let $K=\bar{W} \operatorname{supp}(f)$ where $W=W^{-1}$ is a relatively compact neighbourhood of $e$. For each $y \in K$ we have $|y \cdot f-f(y) 1|: G \rightarrow \mathbb{C}$ (where 1 is the constant function) is continuous with value 0 at $e$; hence there is a neighbourhood $U_{y}$ of $e$ such that

$$
|f(x y)-f(y)|=|y \cdot f(x)-f(y)|<\varepsilon
$$

for $x \in U_{y}$. Find a neighbourhood $V_{y}=V_{y}^{-1}$ of $e$ such that $V_{y}^{2} \subseteq U_{y}$. Then

$$
K \subseteq \bigcup_{y \in K} V_{y} y
$$

so

$$
K \subseteq \bigcup_{j=1}^{n} V_{y_{j}} y_{j}
$$

Let

$$
V=W \cap \bigcap_{j=1}^{n} V_{y}
$$

so $e \in V$ and $V^{-1}=V$. Suppose now $x \in V$. If $y \in K$ then $y \in V_{y_{j}} y_{j} \subseteq U_{y_{j}} y_{j}$ for some $j$; in particular, we have $y y_{j}^{-1} \in V_{y}$. Thus

$$
x y=x y y_{j}^{-1} y_{j} \in V V_{y_{j}} y_{j} \subseteq V_{y_{j}}^{2} y_{j} \subseteq U_{y_{j}} y_{j}
$$

Hence by our choice of $U_{y_{j}}$ we have

$$
|f(x y)-f(y)| \leqslant\left|f(x y)-f\left(y_{j}\right)\right|+\left|f\left(y_{j}\right)-f(y)\right|<2 \varepsilon
$$

If $y \notin K$, suppose we had $W_{y} \cap \operatorname{supp}(f) \neq \varnothing$. Then there would be $z \in W_{y} \cap \operatorname{supp}(f)$; so $z=w y$ for some $w \in W$, and hence $y=w^{-1} z \in W \operatorname{supp}(f) \subseteq K$, a contradiction. So $W y \cap \operatorname{supp}(f)=\varnothing$. Hence if $x \in V \subseteq W$ we would have $f(x y)=0=f(y)$, so $|f(x y)-f(y)|<\varepsilon$.

Proposition 3.2
Theorem 3.3 (Existence of the left Haar integral). There exists a (linear) functional $I: C_{c}(G) \rightarrow \mathbb{C}$ satisfying:

1. I $(f)>0$ if $f \in C_{c}^{+}(G)=\left\{g \in C_{c}(G) \backslash\{0\}: g(x) \geqslant 0\right.$ for all $\left.x \in G\right\}$.
2. $I(f \cdot x)=I(f)$ for all $f \in C_{c}(G)$ and $x \in G$.

Proof. We give a construction in stages.

1. Fix $\varphi$ in $C_{c}^{+}(G)$. Then for $f$ in $C_{c}^{+}(G)$, we let

$$
(f: \varphi)=\inf \left\{\sum_{j=1}^{n} c_{j}: \text { there exist } x_{1}, \ldots, x_{n} \in G, c_{1}, \ldots, c_{n}>0, n \in \mathbb{N} \text { such that } f \leqslant \sum_{j=1}^{n} \varphi \cdot x_{j}\right\}
$$

Notice that if $U=\left\{x \in G: \varphi(x)>\frac{1}{2}\|\varphi\|_{\infty}\right\}$, we see that $\operatorname{supp}(f)$ is covered by finitely many translates $x^{-1} U$; it follows that $(f: \varphi)<\infty$.

Claim 3.4. For $f, g \in C_{c}^{+}(G)$ and $c>0$ we have the following:
(a) $(f \cdot x: \varphi)=(f: \varphi)$.
(b) $(f+g: \varphi) \leqslant(f: \varphi)+(g: \varphi)$.
(c) $(c f: \varphi)=c(f: \varphi)$.
(d) $f \leqslant g \Longrightarrow(f: \varphi) \leqslant(g: \varphi)$.
(e) $(f: \varphi) \leqslant(f: g)(g: \varphi)$.

Proof. The first four are straightforward; we sketch the last. If

$$
\begin{aligned}
& f \leqslant \sum_{j=1}^{n} c_{j} g \cdot x_{j} \\
& g \leqslant \sum_{i=1}^{m} b_{i} \varphi \cdot y_{i}
\end{aligned}
$$

for $c_{j}, b_{i}>0$ and $x_{j}, y_{i} \in G$, then

$$
f \leqslant \sum_{j=1}^{n} \sum_{i=1}^{m} c_{j} b_{i} \varphi \cdot\left(y_{i} x_{j}\right)
$$

and hence

$$
(f: \varphi) \leqslant \sum_{j=1}^{n} c_{j} \sum_{i=1}^{m} b_{i}
$$

and the result follows.

Now, fix another $\psi \in C_{c}^{+}(G)$, and for $f \in C_{c}^{+}(G)$ let

$$
I_{\varphi}(f)=\frac{(f: \varphi)}{(\psi: \varphi)}
$$

Then the first three properties tell us that $I_{\varphi}: C_{c}^{+}(G) \rightarrow[0, \infty)$ is left translation-invariant, subadditive, and $\mathbb{R}^{>0}$-homogeneous. Furthermore, the last property yields that

$$
\begin{aligned}
& (\psi: \varphi) \leqslant(\psi: f)(f: \varphi) \\
& (f: \varphi) \leqslant(f: \psi)(\psi: \varphi)
\end{aligned}
$$

whence it follows that

$$
\begin{equation*}
0<\frac{1}{(\psi: f)} \leqslant I_{\varphi}(f) \leqslant(f: \psi) \tag{1}
\end{equation*}
$$

2. A somewhat technical claim:

Claim 3.5. If $f, g \in C_{c}^{+}(G)$ and $\varepsilon>0$ then there is a neighbourhood $V$ of e such that $I_{\varphi}(f)+I_{\varphi}(g) \leqslant$ $I_{\varphi}(f+g)+\varepsilon$ whenever $\operatorname{supp}(f) \subseteq V$.

Proof. Let $k \in C_{c}^{+}(G)$ satisfy $k \upharpoonright \operatorname{supp}(f+g)=1$; let $\delta>0$, and set $h=f+g+\delta k$. We then let

$$
\begin{aligned}
f^{\prime} & =\frac{f}{h} \\
g^{\prime} & =\frac{g}{h}
\end{aligned}
$$

(with each of them 0 outside of the supports of $f, g$ ). Then by Proposition 3.2 applied to $f^{\prime}, g^{\prime}$ we get a neighbourhood $V$ of $e$ such that

$$
\begin{equation*}
\left|f^{\prime}(x)-f^{\prime}(y)\right|<\delta,\left|g^{\prime}(x)-g^{\prime}(y)\right|<\delta \tag{2}
\end{equation*}
$$

whenever $y^{-1} x \in V$. Suppose $\varphi \in C_{c}^{+}(G)$ with $\operatorname{supp}(\varphi) \subseteq V$; suppose $x_{1}, \ldots, x_{n} \in G$ and $c_{1}, \ldots, c_{n}>0$ satisfy

$$
h \leqslant \sum_{j=1}^{n} c_{j} \varphi \cdot x_{j}^{-1}
$$

Then for $x \in G$ we have

$$
f(x)=f^{\prime}(x) h(x) \leqslant \sum_{j=1}^{n} f^{\prime}(x) c_{j} \varphi\left(x_{j}^{-1} x\right) \leqslant \sum_{j=1}^{n}\left(f^{\prime}\left(x_{j}\right)+\delta\right) c_{j} \varphi_{j}\left(x_{j}^{-1} x\right)
$$

where the last inequality follows from the choice of $\varphi$ and (2). Likewise we see that

$$
g \leqslant \sum_{j=1}^{n}\left(g^{\prime}\left(x_{j}\right)+\delta\right) c_{j} \varphi \cdot x_{j}^{-1}
$$

Now

$$
f^{\prime}+g^{\prime}=\frac{f+g}{h}=\frac{f+g}{f+g+\delta k} \leqslant 1
$$

So

$$
\begin{aligned}
(f \cdot \varphi)+(g: \varphi) & \leqslant \sum_{j=1}^{n}\left(f^{\prime}\left(x_{j}\right)+\delta\right) c_{j}+\sum_{j=1}^{n}\left(g^{\prime}\left(x_{j}\right)+\delta\right) c_{j} \\
& \leqslant \sum_{j=1}^{n}(1+2 \delta) c_{j}
\end{aligned}
$$

Recall that our $\psi$ is fixed. Now, dividing by $(\psi: \varphi)$ and taking infimum in the $c_{j}$ relative to the definition of $(h: \varphi)$, and applying Claim 3.4, we see that

$$
I_{\varphi}(f)+I_{\varphi}(g) \leqslant(1+2 \delta) I_{\varphi}(h) \leqslant(1+2 \delta)\left(I_{\varphi}(f+g)+\delta I_{\varphi}(k)\right)
$$

Now, choose $\delta>0$ (and hence $V$ ) small enough so that

$$
2 \delta I_{\varphi}(f+g)+(1+2 \delta) \delta I_{\varphi}(k)<\varepsilon
$$

and the claim follows.
Claim 3.5
3. We are now ready to draw our conclusion. Consider

$$
X=\prod_{f \in C_{c}^{+}(G)}\left[\frac{1}{(\psi: f)},(\varphi: f)\right]
$$

which is compact by Tychonoff's theorem. By Equation (1) we get $\left(I_{\varphi}(f)\right)_{f \in C_{c}^{+}(G)} \in X$ for any $\varphi \in C_{c}^{+}(G)$.
Given a neighbourhood $V$ of $e$ we let

$$
K(V)=\overline{\left\{\left(I_{\varphi}(f)\right)_{f \in C_{c}^{+}(G)}: \operatorname{supp}(\varphi) \subseteq V\right\}} \subseteq X
$$

Then $K$ is a closed set of a compact space, and is thus compact. Then if $V_{1}, \ldots, V_{n}$ are neighbourhoods of $e$, then

$$
\bigcap_{j=1}^{n} K\left(V_{j}\right) \supseteq K\left(\bigcap_{j=1}^{n} V_{j}\right) \neq \varnothing
$$

Thus $S=\bigcap\{K(V): V$ a neighbourhood of $e\} \neq \varnothing$ by finite intersection property; let $(I(f))_{f \in C_{c}^{+}(G)} \in$ $S$. Given $f, g \in C_{c}^{+}(G)$ and $\varepsilon>0$ there is a neighbourhood $V$ of $e$ and $\varphi \in C_{c}^{+}(G)$ with $\operatorname{supp}(\varphi) \subseteq V$ such that

$$
\begin{array}{r}
\left|I(f)-I_{\varphi}(f)\right|<\varepsilon \\
\left|I(g)-I_{\varphi}(g)\right|<\varepsilon \\
\left|I(f+g)-I_{\varphi}(f+g)\right|<\varepsilon
\end{array}
$$

and further by Claim 3.5 and Claim 3.4 we can arrange $V$ such that

$$
\left|I_{\varphi}(f)+I_{\varphi}(g)-I_{\varphi}(f+g)\right|<\varepsilon
$$

We then find that

$$
|I(f)+I(g)-I(f+g)|<4 \varepsilon
$$

Since $\varepsilon>0$ is arbitrary, we find that $I: C_{c}^{+}(G) \rightarrow(0, \infty)$ is an additive functional. By Claim 3.4, we get that $I$ is $\mathbb{R}^{>0}$-homogeneous.
We now extend $I$ to all of $C_{c}(G)$. We set $I(0)=0$. Suppose $f \in C_{c}^{\mathbb{R}}(G)$ (i.e. it is real-valued) and we can write $f=f_{1}-f_{2}=g_{1}-g_{2}$ for $f_{1}, f_{2}, g_{1} g_{2} \geqslant 0$. Then $f_{1}+g_{2}=g_{1}+f_{2}$, so $I\left(f_{1}+g_{2}\right)=I\left(g_{+} f_{2}\right)$, and by additivity we get that $I(f)=I\left(f_{1}\right)-I\left(f_{2}\right)=I\left(g_{1}\right)-I\left(g_{2}\right)$ is well-defined. This clearly is $\mathbb{R}$-homogeneous. Now for arbitrary $f \in C_{c}(G)$, we let

$$
I(f)=I(\operatorname{Re} f)+i I(\operatorname{Im} f)
$$

It is straightforward to check that $I$ is $\mathbb{C}$-homogeneous. It then follows from Claim 3.4 and the definition of $S$ that $I(f \cdot x)=I(f)$ for $f \in C_{c}^{+}(G)$ and $x \in G$. Hence this left-invariance holds generally. Finally, for $f \in C_{c}^{+}(G)$, we have $I(f)>0$ by definition of $S \subseteq X$.Theorem 3.3

Theorem 3.6 (Existence of left Haar measure). Let $\mathcal{B}(G)=\sigma\langle\tau\rangle$ (the $\sigma$-algera on $G$ generated by open sets) be the Borel $\sigma$-algebra. Then there is a measure $m: \mathcal{B}(G) \rightarrow[0, \infty]$ satisfying the following:

1. $m$ is a Radon measure: it is outer regular $(m(E)$ is the infimum of the measures of the open sets containing $E$ ), inner regular on open sets $(m(E)$ is the supremum of the measures of compact sets contained in $E$, if $E$ is open), finite on compact sets.
2. $m$ is left-invariant: if $E \in \mathcal{B}(G)$ and $x \in G$ then $m(x E)=m(E)$.
3. $m(U)>0$ for any $U \in \tau \backslash\{\varnothing\}$.

Sketch of proof. The Riesz representation theorem provides a Radon measure $m$ for which

$$
I(f)=\int_{G} f \mathrm{~d} m
$$

for all $f \in C_{c}(G)$. We have for $x \in G$ that

$$
\int_{G} f(x y) \mathrm{d} m(y)=I(f \cdot x)=I(f)=\int_{G} f \mathrm{~d} m
$$

In particular, if $U$ is open then for $f \in C_{c}(G)$ we have $\operatorname{supp}(f) \subseteq U$ if and only if $\operatorname{supp}(f \cdot x) \subseteq x^{-1} U$, so

$$
\begin{aligned}
m(U) & =\sup \left\{I(f): f \in C_{c}^{[0,1]}(G), \operatorname{supp}(f) \subseteq U\right\} \\
& =\sup \left\{I(f \cdot x): f \in C_{c}^{[0,1]}(G), \operatorname{supp}(f \cdot x) \subseteq x^{-1} U\right\} \\
& =m\left(x^{-1} U\right)
\end{aligned}
$$

So we see that $m(U)=m(x U)$ for $x \in G$. Then if $E \in \mathcal{B}(G)$ we have

$$
m(E)=\inf \{m(U): E \subseteq U \in \tau\}
$$

and it follows that $m(x E)=m(E)$. That $m(U)>0$ for $U \in \tau \backslash\{\varnothing\}$ follows from

$$
m(U)=\sup \left\{I(f): f \in C_{c}^{[0,1]}(G), \operatorname{supp}(f) \subseteq U\right\}
$$

and that $I(f)>0$ for $f \in C_{c}^{+}(G)$.
Theorem 3.6
Theorem 3.7 ("Uniqueness" of left Haar measure). If $m^{\prime}: \mathcal{B}(G) \rightarrow[0, \infty]$ is a left-invariant measure, then there is $c \geqslant 0$ such that $m^{\prime}=\mathrm{cm}$.

Proof. It suffices to show that the map

$$
f \mapsto \frac{\int_{G} f \mathrm{~d} m^{\prime}}{\int_{G} f \mathrm{~d} m}
$$

is constant for $f$ in $C_{c}^{+}(G)$. This constant $c \geqslant 0$ hence satisfies that

$$
\int_{G} f \mathrm{~d} m^{\prime}=c \int_{G} f \mathrm{~d} m
$$

and it will follow that $m^{\prime}=c m$. To this end, fix $f, g \in C_{c}^{+}(G)$ and $\varepsilon>0$. By uniform continuity of $f$ and $g$ there is a neighbourhood $V=V^{-1}$ of $e$ such that

$$
\begin{aligned}
& |f(x y)-f(y x)|<\varepsilon \\
& |g(x y)-g(y x)|<\varepsilon
\end{aligned}
$$

for $x \in V, y \in G$. Fix $h \in C_{c}^{+}(G)$ satisfying $h\left(x^{-1}\right)=h(x)$ for $x \in G$ and $\operatorname{supp}(h) \subseteq V$. (One could for example pick $h^{\prime} \in C_{c}^{+}(G)$ with $\operatorname{supp}\left(h^{\prime}\right) \subseteq V$ and let $h(x)=h^{\prime}(x)+h^{\prime}\left(x^{-1}\right)$.) We use Tonelli's theorem:

$$
\int h \mathrm{~d} m \int f \mathrm{~d} m^{\prime}=\iint h(x) f(y) \mathrm{d} m(x) \mathrm{d} m^{\prime}(y)=\iint h(x) f(x y) \mathrm{d} m(x) \mathrm{d} m^{\prime}(y)
$$

and

$$
\begin{aligned}
\int h \mathrm{~d} m^{\prime} \int f \mathrm{~d} m & =\iint h(y) f(x) \mathrm{d} m^{\prime}(y) \mathrm{d} m(x) \\
& =\iint h\left(x^{-1} y\right) f(x) \mathrm{d} m^{\prime}(y) \mathrm{d} m(x) \\
& =\iint h\left(x^{-1} y\right) f(x) \mathrm{d} m(x) \mathrm{d} m^{\prime}(y) \\
& =\iint h\left(x^{-1}\right) f(y x) \mathrm{d} m(x) \mathrm{d} m^{\prime}(y) \\
& =\iint h(x) f(y x) \mathrm{d} m(x) \mathrm{d} m^{\prime}(y)
\end{aligned}
$$

Thus

$$
\begin{aligned}
\left|\int h \mathrm{~d} m \int f \mathrm{~d} m^{\prime}-\int h \mathrm{~d} m^{\prime} \int f \mathrm{~d} m\right| & \leqslant \iint h(x) \underbrace{|f(x y)-f(y x)|}_{<\varepsilon} \mathrm{d} m^{\prime}(y) \mathrm{d} m(x) \\
& \leqslant \varepsilon m^{\prime}(\underbrace{V \operatorname{supp}(f) \cup \operatorname{supp}(f) V}_{S_{f, V}}) \int h \mathrm{~d} m
\end{aligned}
$$

So

$$
\left|\frac{\int f \mathrm{~d} m^{\prime}}{\int f \mathrm{~d} m}-\frac{\int h \mathrm{~d} m^{\prime}}{\int h \mathrm{~d} m}\right| \leqslant \varepsilon \frac{m^{\prime}\left(S_{f, V}\right)}{\int f \mathrm{~d} m}
$$

Likewise we get

$$
\left|\frac{\int g \mathrm{~d} m^{\prime}}{\int g \mathrm{~d} m}-\frac{\int h \mathrm{~d} m^{\prime}}{\int h \mathrm{~d} m}\right| \leqslant \varepsilon \frac{m^{\prime}\left(S_{g, V}\right)}{\int g \mathrm{~d} m}
$$

so

$$
\left|\frac{\int f \mathrm{~d} m^{\prime}}{\int f \mathrm{~d} m}-\frac{\int g \mathrm{~d} m^{\prime}}{\int g \mathrm{~d} m}\right| \leqslant \varepsilon\left(\frac{m^{\prime}\left(S_{f, V}\right)}{\int f \mathrm{~d} m}+\frac{m^{\prime}\left(S_{g, V}\right)}{\int g \mathrm{~d} m}\right)
$$

Notice though that if $V^{\prime} \subseteq V$ then $S_{f, V^{\prime}} \subseteq S_{f, V}$; thus if we shrink $\varepsilon>0$ we shrink $V$.Theorem 3.7

TODO 3. Missing stuff
Last time: introduced $L^{1}(G)=\overline{S^{1}(G)}{ }^{\|\cdot\|_{1}}=\overline{C_{c}(G)}{ }^{\|\cdot\|_{1}}$ the closure of the simple integrable functions. (The latter equality because $m$ is regular on open sets.)

## 4 The modular function

Given $E \in \mathcal{B}(G)$ we have that $E x \in \mathcal{B}(G)$ for $x \in G$. (Since $R_{x}: G \rightarrow G$ is a homeomorphism and $E x=R_{x^{-1}}^{-1}(E)$.) Define $m_{x}: \mathcal{B}(G) \rightarrow[0, \infty]$ by $m_{x}(E)=m(E x)$. One can check that $m_{x}$ is left-invariant and positive on open sets. Hence by Theorem 3.7 we get $m_{x}=\Delta(x) m$ for some $\Delta(x) \in(0, \infty)$.

Notice that if $y \in G$ then for $E$ with $0<m(E)<\infty$ we get

$$
\Delta(x y) m(E)=m(E x y)=\Delta(y) m(E x)=\Delta(x) \Delta(y) m(E)
$$

so $\Delta: G \rightarrow(0, \infty) \subseteq \mathbb{R}^{\times}$is a homomorphism.
Definition 4.1. We call this the modular function. We say $G$ is unimodular if $\Delta=1$.

## Proposition 4.2.

1. For $f \in L^{1}(G)$ (or $\left.f \in C_{c}(G)\right)$ we have for $x \in G$ that

$$
\int_{G} f \mathrm{~d} m=\Delta(x) \int_{G} x \cdot f \mathrm{~d} m
$$

2. $\Delta: G \rightarrow(0, \infty) \subseteq \mathbb{R}^{\times}$is continuous.

Proof.

1. If $E \in \mathcal{B}(G)$ with $m(E)<\infty$ then

$$
\Delta(x) \int_{G} 1_{E} \mathrm{~d} m=\Delta(x) m(E)=m(E x)=\int_{G} 1_{E x} \mathrm{~d} m=\int_{G} x^{-1} \cdot 1_{E} \mathrm{~d} m
$$

So, replacing $x$ by $x^{-1}$, we see that

$$
\Delta(x) \int_{G} x \cdot 1_{E} \mathrm{~d} m=\int_{G} 1_{E} \mathrm{~d} m
$$

Then, if $\varphi \in S^{1}(G)$, then

$$
\int_{G} \varphi \mathrm{~d} m=\Delta(x) \int_{G} x \cdot \varphi \mathrm{~d} m
$$

Now, if $f \in L_{+}^{1}(G)$ (i.e. $f \geqslant 0 m$-almost-everywhere), then there is $\left(\varphi_{n}\right)_{n=1}^{\infty} \subseteq S_{+}^{1}(G)$ such that $\varphi_{n} \nearrow f$ (increasing pointwise converges) $m$-almost-everywhere. Then by monotone convergence theorem we get

$$
\int_{G} x \cdot f \mathrm{~d} m=\lim _{n \rightarrow \infty} \int_{G} x \cdot \varphi_{n} \mathrm{~d} m=\lim _{n \rightarrow \infty} \frac{1}{\Delta(x)} \int_{G} \varphi_{n} \mathrm{~d} m=\frac{1}{\Delta(x)} \int_{G} f \mathrm{~d} m
$$

We are now done, since $L^{1}(G)=\operatorname{span}\left(L_{+}^{1}(G)\right)$.
2. Suppose $f \in C_{c}^{+}(G), \varepsilon>0$, and $V=V^{-1}$ is a relatively compact neighbourhood of $e$ such that $\|x \cdot f-f\|_{\infty}<\varepsilon$ for $x \in V$. Then for $x \in V$ we have

$$
|\Delta(x)-1|=\frac{\left|\int_{G} x \cdot f \mathrm{~d} m-\int_{G} f \mathrm{~d} m\right|}{\int_{G} f \mathrm{~d} m} \leqslant \frac{\int_{G}|x \cdot f-f| \mathrm{d} m}{\int_{G} f \mathrm{~d} m} \leqslant \varepsilon \frac{m(\operatorname{supp}(f) V)}{\int_{G} f \mathrm{~d} m}
$$

Picking $\varepsilon^{\prime}<\varepsilon$ necessitates taking $V^{\prime} \subseteq V$, so we see that $\Delta$ is continuous at $e$. Now if $y \in G$ and $x \in V$ then

$$
|\Delta(x y)-\Delta(y)|=|\Delta(x)-1| \Delta(y) \leqslant \varepsilon \Delta(y)
$$

so $\Delta$ is continuous at $y$.
Notation 4.3. For the left integral we write

$$
\int_{G} f(x) \mathrm{d} x
$$

or less commonly

$$
\int_{G} f(x) \mathrm{d} m(x)
$$

to mean

$$
\int_{G} f \mathrm{~d} m
$$

## Proposition 4.4.

1. The integral on $C_{c}(G)$ given by

$$
f \mapsto \int_{G} f(x) \frac{1}{\Delta(x)} \mathrm{d} x
$$

is right-invariant.
2. For $f \in L^{1}(G)$ we have

$$
\int_{G} f\left(x^{-1}\right) \frac{1}{\Delta(x)} \mathrm{d} x=\int_{G} f(x) \mathrm{d} x
$$

Proof.

1. If $y \in G$ and $f \in C_{c}(G)$ we have

$$
\int_{G} y \cdot f(x) \frac{1}{\Delta(x)} \mathrm{d} x=\int_{G} f(x y) \frac{1}{\Delta(x y)} \Delta(y) \mathrm{d} x=\frac{\Delta(y)}{\Delta(y)} \int_{G} f(x) \frac{1}{\Delta(x)} \mathrm{d} x=\int_{G} f(x) \frac{1}{\Delta(x)} \mathrm{d} x
$$

2. We have for $f \in C_{c}^{+}(G)$ and $y \in G$ that

$$
0<\int_{G} f \cdot y\left(x^{-1}\right) \frac{1}{\Delta(x)} \mathrm{d} x=\int_{G} f\left(y x^{-1}\right) \frac{1}{\Delta(x)} \mathrm{d} x=\int_{G} f\left(\left(x y^{-1}\right)^{-1}\right) \frac{1}{\Delta(x)} \mathrm{d} x=\int_{G} f\left(x^{-1}\right) \frac{1}{\Delta(x)} \mathrm{d} x
$$

by the first part. (Notice that $\iota: G \rightarrow G$ given by $x \mapsto x^{-1}$ is a homeomorphism, and hence Borel measurable, so $f \circ \iota$ is Borel measurable if $f$ is.) Hence there is $c>0$ such that

$$
\int_{G} f\left(x^{-1}\right) \frac{1}{\Delta(x)} \mathrm{d} x=c \int_{G} f(x) \mathrm{d} x
$$

for $f \in C_{c}(G)$ (and hence $f \in L^{1}(G)$ ).
Now, if $c \neq 1$ then there is a relatively compact neighbourhood $U=U^{-1}$ of $e$ such that

$$
\left|\frac{1}{\Delta(x)}-1\right|<\frac{1}{2}|c-1|
$$

for $x \in U$. Then

$$
\begin{aligned}
0 & =|\int_{G} \underbrace{1_{U}(x)}_{=1 U(x-1)} \frac{1}{\Delta(x)} \mathrm{d} x-c \int_{G} 1_{U}(x) \mathrm{d} x| \\
& =\left|\int_{U}\left(\frac{1}{\Delta(x)}-c\right) \mathrm{d} x\right| \\
& =\left|\int_{U}\left(1-c+\frac{1}{\Delta(x)}-1\right) \mathrm{d} x\right| \\
& =\left|(1-c) m(U)+\int_{U}\left(\frac{1}{\Delta(x)}-1\right) \mathrm{d} x\right| \\
& \geqslant(1-c) m(U)-\left|\int_{U}\left(\frac{1}{\Delta(x)}-1\right) \mathrm{d} x\right| \\
& >m(U)\left(|1-c|-\frac{1}{2}|c-1|\right) \\
& =\frac{1}{2}|c-1| m(U) \\
& >0
\end{aligned}
$$

a contradiction. So $c=1$.
Notation 4.5. If $x \in G$ and $f \in L^{1}(G)$, we define $x * f, f * x, f^{*} \in L^{1}(G)$ by declaring for $m$-almost-every $y$ that

$$
\begin{aligned}
x * f(y) & =f\left(x^{-1} y\right) \\
f * x(y) & =f\left(y x^{-1}\right) \frac{1}{\Delta(x)} \\
f^{*}(y) & =\overline{f\left(y^{-1}\right)} \frac{1}{\Delta(y)}
\end{aligned}
$$

The last proposition then tells us that

$$
\|f\|_{1}=\int_{G}|f(x)| \mathrm{d} x=\|x * f\|_{1}=\|f * x\|_{1}=\left\|f^{*}\right\|_{1}
$$

Notice that

$$
\begin{aligned}
x *(y * f) & =(x y) * f \\
(f * x) * y & =f *(x y) \\
(f * x)^{*} & =x^{-1} * f \\
\left(f^{*}\right)^{*} & =f \\
x * f & =f \cdot x^{-1}
\end{aligned}
$$

Proposition 4.6. For $f \in L^{1}(G)$ we have

$$
\lim _{x \rightarrow e}\|x * f-f\|_{1}=0=\lim _{x \rightarrow e}\|f * x-f\|_{1}
$$

Proof. First, consider $g \in C_{c}(G)$. Suppose $\varepsilon>0$; let $V=V^{-1}$ be a relatively compact neighbourhood of $e$ such that

$$
\begin{aligned}
&\|x \cdot g-g\|_{\infty}<\varepsilon \\
&\left|\frac{1}{\Delta(x)}-1\right|<\varepsilon
\end{aligned}
$$

for all $x \in V$. Then

$$
\begin{aligned}
\|g * x-g\|_{1} & \leqslant\|g * x-g\|_{\infty} m(\operatorname{supp}(g) V) \\
& \leqslant\left(\frac{1}{\Delta(x)}\left\|x^{-1} \cdot g-g\right\|_{\infty}+\left|\frac{1}{\Delta(x)}-1\right|\|g\|_{\infty}\right) m(\operatorname{supp}(g) V) \\
& \leqslant\left((1+\varepsilon) \varepsilon+\varepsilon\|g\|_{\infty}\right) m(\operatorname{supp}(g) V)
\end{aligned}
$$

So we're done. Now if $f \in L^{1}(G)$ and $\varepsilon>0$, we can find $g \in C_{c}(G)$ such that $\|f-g\|_{1}<\varepsilon$; it then follows by the usual estimates that

$$
\limsup _{x \rightarrow e}\|f * x-f\|_{1}<3 \varepsilon
$$

and so, as $\varepsilon>0$ is arbitrary, we get the limit, as desired.
Theorem 4.7 (Weil's integral relation). Let $N$ be a closed normal subgrape of $G$.

1. If $f \in C_{c}(G)$ then the map $x \mapsto \int_{N} f(x n) \mathrm{d} n$ is constant of cosets of $N$, and hence defines a map $T_{N} f$ on $G / N$. Furthermore $T_{N} f \in C_{c}(G)$, and the operator $T_{N}: C_{c}(G) \rightarrow C_{c}(G / N)$ satisfies
(a) $T_{N}\left(C_{c}^{+}(G)\right) \subseteq C_{c}^{+}(G / N)$
(b) $T_{N}(f \cdot y)=\left(T_{N} f\right) \cdot(y N)$ for $y \in G$.
2. The functional

$$
f \mapsto \int_{G / N} T_{N} f(x N) \mathrm{d} x N
$$

is a left Haar integral. Hence we may write

$$
\int_{G / N} \int_{N} f(x n) \mathrm{d} n \mathrm{~d} x N
$$

(Notice that the constant on $m_{G}$ is thus dictated by choices of $m_{N}$ and $m_{G / N}$.)
Proof.

1. Notice that if $n^{\prime} \in N$ then

$$
\int_{N} f\left(x n^{\prime} n\right) \mathrm{d} n=\int_{N} f(x n) \mathrm{d} n
$$

Hence we get a function $T_{N} f: G / N \rightarrow \mathbb{C}$.
We check continuity on $G / N$. Suppose $\varepsilon>0$, fix $V=V^{-1}$ a relatively compact neighbourhood of $e$; so $\|f \cdot y-f\|_{\infty}<\varepsilon$ for $y \in V$. Then fix $x \in G$ and $h \in C_{c}^{[0,1]}(G)$ with $h \upharpoonright V x^{-1} \operatorname{supp}(f)=1$. Then for $y \in V$ (so $y N \in q_{N}(V)$ where $q_{N}: G \rightarrow G / N$ is the quotient map) we have

$$
|T_{N} f(\underbrace{y x N}_{y N x N})-T_{N} f(x N)|=\left|\int_{N}(f(y x n)-f(x n)) \mathrm{d} n\right| \leqslant \int_{N}|f(y x n)-f(x n)| h(n) \mathrm{d} n \leqslant \varepsilon m_{N}(\operatorname{supp}(h) \cap N)
$$

which shows continuity since if $\varepsilon^{\prime}<\varepsilon$ we can build $h$ with smaller support. So $T_{N} f$ is continuous. Also $\operatorname{supp}\left(T_{N} f\right) \subseteq q_{N}(\operatorname{supp}(f))$ is compact, so $T_{N} f \in C_{c}(G / N)$.
If $f \in C_{c}^{+}(G)$ has $f(x)>0$ for some $x \in G$, we can find an open neighbourhood $U$ of $e$ such that $f(x y)>\frac{1}{2} f(x)$ for $y \in U$. Then

$$
T_{N} f(x N)=\int_{N} f(x n) \mathrm{d} n \geqslant \int_{U \cap N} \frac{1}{2} f(x) \mathrm{d} n=\frac{1}{2} f(x) m_{N}(U \cap N)>0
$$

(Clearly $f(x N) \geqslant 0$ for general $x$.) Finally

$$
T_{N}(f \cdot y)(x N)=\int_{N} f \cdot y(x n) \mathrm{d} n=\int_{N} f(y x n) \mathrm{d} n=T_{N} f(y x N)=\left(T_{N} f\right) \cdot(y N)(x N)
$$

2. Follows from the first part immediately.

Theorem 4.7
Corollary 4.8. The modular functions on $G$ and $N$ satisfy $\Delta_{N}=\Delta_{G} \upharpoonright N$.
Proof. If $n^{\prime} \in N$ and $f \in C_{c}^{+}(G)$ then

$$
\begin{aligned}
\int_{G} n^{\prime} \cdot f(x) \mathrm{d} x & =\int_{G / N} \int_{N} n^{\prime} \cdot f(x n) \mathrm{d} n \mathrm{~d} x N \\
& =\int_{G / N} \int_{N} f\left(x n n^{\prime}\right) \mathrm{d} n \mathrm{~d} x N \\
& =\int_{G / N} \frac{1}{\Delta_{N}\left(n^{\prime}\right)} \int_{N} f(x n) \mathrm{d} n \mathrm{~d} x N \\
& =\frac{1}{\Delta_{n}\left(n^{\prime}\right)} \int_{G} f(x) \mathrm{d} x
\end{aligned}
$$

so $\Delta_{n}\left(n^{\prime}\right)=\Delta_{G}\left(n^{\prime}\right)$.
Corollary 4.8
Unimodularity makes computing integrals simpler. Indeed,

$$
\int_{G} f(x) \mathrm{d} x=\int_{G} f(y x) \mathrm{d} x=\int_{G} f(x y) \mathrm{d} x=\int_{G} f\left(x^{-1}\right) \mathrm{d} x
$$

Proposition 4.9. $G$ is unimodular in the following cases:

1. $G$ is abelian, compact, or discrete
2. $G$ is perfect: i.e. $G=\overline{[G, G]}$ (the closure of the grape generated by the commutators $[x, y]=x y x^{-1} y^{-1}$ ).
3. $G / Z(G)$ is unimodular $(Z(G)$ is the centre.
4. $G$ admits a unimodular closed normal subgrape $N$ for which $G / N$ is compact.

Proof.

1. Trivial for $G$ abelian; for $G$ compact, the (left) Haar measure is the counting measure.

Let us fully consider the compact case. Here $\Delta(G)$ is a compact subgrape of $(0, \infty) \subseteq \mathbb{R}^{\times}$. The map $\log :(0, \infty) \rightarrow \mathbb{R}$ is an isomorphism. If $\alpha \in \mathbb{R} \backslash\{0\}$ then $\mathbb{Z} \alpha$ is not compact. Hence $\{0\}$ is the only compact subgrape of $\mathbb{R}$, and hence $\{1\}$ is the only compact subgrape of $(0, \infty)$.
2. It is clear that $\Delta\left(\left[x_{1}, y_{1}\right] \cdots\left[x_{n}, y_{n}\right]\right)=1$; by continuity, we then get $\Delta(x)=1$ for all $x \in G$.
3. We should note that $Z=Z(G)$ is closed and normal. If $y \in G$ and $f \in C_{c}(G)$ then

$$
\begin{aligned}
\int_{G} y \cdot f(x) \mathrm{d} x & =\int_{G / Z} \int_{Z} y \cdot f(x z) \mathrm{d} z \mathrm{~d} x Z \\
& =\int_{G / Z} \int_{Z} f(x z y) \mathrm{d} z \mathrm{~d} x Z \\
& =\int_{G / Z} \int_{Z} f(x y z) \mathrm{d} z \mathrm{~d} x Z \\
& =\int_{G / Z} T_{Z} f(x Z y Z) \mathrm{d} x Z \\
& =\int_{G / Z} T_{Z} f(x Z) \mathrm{d} x Z \\
& =\int_{G} f(x) \mathrm{d} x
\end{aligned}
$$

Hence $\Delta(y)=1$.
4. Since $\Delta_{G} \upharpoonright N=\Delta_{N}=1$, we get a homomorphism $\bar{\Delta}: G / N \rightarrow(0, \infty)$ (by 1st isomorphism theorem) with $\bar{\Delta} \circ q_{N}=\Delta_{G}$. If $W \subseteq(0, \infty)$ is open, then

$$
\bar{\Delta}^{-1}(W)=\underbrace{q_{N}}_{\text {open map }}(\underbrace{\Delta^{-1}(W)}_{\text {open in } G})
$$

Thus $\bar{\Delta}$ is continuous. By (1), we get that $\bar{\Delta}(G / N)=\{1\}$. $\square$ Proposition 4.9

## Example 4.10.

1. Suppose $\mathbb{K}$ is a locally compact field. Let $|\mathbb{K}|>3$. (Aside: we will use capital letters for singular matrices and lower-case for invertible matrices.) Let $\left\{E_{i j}\right\}_{i, j=1}^{n}$ be the matrix unit for $M_{n}(\mathbb{K})$ : i.e. $E_{i j} E_{k \ell}=\delta_{j k} E_{i \ell}$. We will show that $\mathrm{SL}_{n}(\mathbb{K})$ is perfect, and hence unimodular.
(a) If $\lambda \in \mathbb{K}$ and $i, j, k$ are distinct (for $n \geqslant 3$ ) then

$$
\left[e+\lambda E_{i k}, e+E_{k j}\right]=\left(e+\lambda E_{i k}\right)\left(e+E_{k j}\right)\left(e-\lambda E_{i k}\right)\left(e-E_{k j}\right)=e+\lambda E_{i j}
$$

If $n=2$ we have

$$
\left[\left(\begin{array}{cc}
\alpha & 0 \\
0 & \alpha^{-1}
\end{array}\right)\left(\begin{array}{ll}
1 & \beta \\
0 & 1
\end{array}\right)\right]=\left(\begin{array}{cc}
1 & \left(1-\alpha^{2}\right) \beta \\
0 & 1
\end{array}\right)
$$

and the equation $\lambda=\left(1-\alpha^{2}\right) \beta$ always admits solutions for $|\mathbb{K}|>3$.
(b) We claim $S=\left\langle e+\lambda E_{i j}: \lambda \in \mathbb{K}, i, j \in\{1, \ldots, n\}, i \neq j\right\rangle$ is all of $\mathrm{SL}_{n}(\mathbb{K})$. Indeed, using only elementary operations of adding one row to another, for any $a \in \mathrm{SL}_{n}(\mathbb{K})$ there is $s \in S$ for which $s a$ is diagonal:

$$
s a=\operatorname{diag}\left(\alpha_{1}, \ldots, \alpha_{n}\right)=\left(\begin{array}{llll}
\alpha_{1} & & & \\
& \alpha_{2} & & \\
& & \ddots & \\
& & & \alpha_{n}
\end{array}\right)
$$

Then see that

$$
\left(e+E_{12} \operatorname{diag}\left(\alpha_{1}, \ldots, \alpha_{n}\right)\left(e+\frac{1-\alpha_{1}}{\alpha_{2}} E_{21}\right)=\left(\begin{array}{ccccc}
1 & \alpha_{2} & & & \\
1-\alpha_{1} & \alpha_{2} & & & \\
& & \alpha_{3} & & \\
& & & \ddots & \\
& & & & \alpha_{n}
\end{array}\right)\right.
$$

and

$$
\left(e+\left(\alpha_{1}-1\right) E_{21}\right)\left(\begin{array}{ccccc}
1 & \alpha_{2} & & & \\
1-\alpha_{1} & \alpha_{2} & & & \\
& & \alpha_{3} & & \\
& & & \ddots & \\
& & & & \alpha_{n}
\end{array}\right)\left(e-\alpha_{2} E_{12}\right)=\left(\begin{array}{lllll}
1 & & & \\
& \alpha_{1} \alpha_{2} & & & \\
& & \alpha_{3} & & \\
& & & \ddots & \\
& & & & \alpha_{n}
\end{array}\right)
$$

An evident induction shows that $a \in S$.
(c) Combining the two statements, we get $\mathrm{SL}_{n}(\mathbb{K})=S \subseteq\left[\mathrm{SL}_{n}(\mathbb{K}), \mathrm{SL}_{n}(\mathbb{K})\right] \subseteq \mathrm{SL}_{n}(\mathbb{K})$.
2. Let $\mathbb{K} \in\{\mathbb{R}, \mathbb{C}\}$ and $G=\mathrm{GL}_{n}(\mathbb{K})$. We observe that $Z=Z\left(\mathrm{GL}_{n}(\mathbb{K})\right)=\mathbb{K}^{\times} e$. Also from the first example we have that $\mathrm{SL}_{n}(\mathbb{K})=[G, G]$. Let $H=Z \cdot \mathrm{SL}_{n}(\mathbb{K})$.
If $n$ is odd and $\mathbb{K}=\mathbb{R}$ or $n$ is arbitrary and $\mathbb{K}=\mathbb{C}$ then $H=G$. If $n$ is even and $\mathbb{K}=\mathbb{R}$, then $H=\mathrm{GL}_{n}(\mathbb{R})_{0}=\operatorname{det}^{-1}((0, \infty))$ is open, and thus closed; furthermore, we get $\mathrm{GL}_{n}(\mathbb{R})_{0} \sqcup a \mathrm{GL}_{n}(\mathbb{R})$ where $\operatorname{det}(a)=-1$.
Either way, we get that $H$ is open and normal in $G$ with $G / H$ finite, and hence compact. We have $H / Z \cong \mathrm{SL}_{n}(\mathbb{K}) / Z_{\cap} \mathrm{SL}_{n}(\mathbb{K})$. But $\mathrm{SL}_{n}(\mathbb{K})$ is perfect, and hence the quotient is perfect; so $H / Z$ is unimodular. Thus so is $H$ and hence $G$.
3. (Euclidean motion.) We let $E(n)=\mathbb{R} \rtimes \mathrm{SO}(n)$. ( $\mathrm{SO}(n)$ is the orthogonal real matrices of determinant 1.) Then $N=\mathbb{R} \rtimes\{e\}$ is normal and unimodular, with $E(n) / N \cong \operatorname{SO}(n)$ compact. Hence $E(n)$ is unimodular.
4. (Heisenberg.) Let

$$
\mathbb{H}=\left\{\left(\begin{array}{lll}
1 & x & z \\
& 1 & y \\
& & 1
\end{array}\right): x, y, z \in \mathbb{R}\right\} \subseteq \mathrm{GL}_{3}(\mathbb{R})
$$

a closed subgrape. We have

$$
Z(\mathbb{H})=\left\{\left(\begin{array}{lll}
1 & 0 & z \\
& 1 & 0 \\
& & 1
\end{array}\right): z \in \mathbb{R}\right\}
$$

and $\mathbb{H} / Z(\mathbb{H}) \cong \mathbb{R}^{2}$. Thus $\mathbb{H}$ is unimodular.
5. (Conjugation automorphism.) For $x \in G$, let $\gamma(x) \in \operatorname{Aut}(G)$ be $\gamma(x)(y)=x y x^{-1}$. Notice $\gamma\left(x x^{\prime}\right)=$ $\gamma(x) \gamma\left(x^{\prime}\right)$. Then

$$
\delta(\gamma(x))=\frac{1}{\Delta(x)}
$$

(where $\delta$ is as in assignment 1).
Suppose $\alpha \in \operatorname{Aut}(G)$. If $G$ is compact, then $\alpha(G)=G$ implies $\delta(\alpha)=1$. If $G$ is discrete, then $|\alpha(F)|=|F|$ for each finite $F \subseteq G$ implies $\delta(\alpha)=1$.
Suppose $G, A$ are unimodular and $A$ acts continuously on $G$ by automorphisms. Consider $S=G \rtimes A$. Then by assignment 1 we get $\Delta(y, \beta)=\delta(\beta)$.
6. If $H$ is open in $G$ and $G$ is unimodular, then $H$ is unimodular.

However, if $H$ is closed and non-open in $G$, we may have that $G$ is unimodular and $H$ is not. Consider for example $G=\mathrm{SL}_{2}(\mathbb{R})$ and

$$
H=\left\{\left(\begin{array}{cc}
a & b \\
0 & a^{-1}
\end{array}\right): \alpha \in(0, \infty), b \in \mathbb{R}\right\}
$$

Then $H=\mathbb{R} \rtimes(0, \infty)$ with $a(b)=a b$ (non-unimodular action) so $H$ is not unimodular thanks to the first item.
7. It is possible that $N$ is a unimodular open normal subgrape of $G$ yet $G$ is not unimodular. Indeed, consider $G=\mathbb{R} \rtimes\left\{2^{n}: n \in \mathbb{Z}\right\}$; this is an open subgrape of $\mathbb{R} \rtimes(0, \infty)$.

## 5 The convolution algebra of measures

Let

$$
\begin{aligned}
M(G) & =\{\mu: \mathcal{B}(G) \rightarrow \mathbb{C} \mid \mu \text { a Radon measure }\} \\
M_{+}(G) & =\{\mu: \mathcal{B}(G) \rightarrow[0, \infty) \mid \mu \text { a (finite) measure }\}
\end{aligned}
$$

Definition 5.1. If $E \in \mathcal{B}(G)$, we define the total variation to be

$$
|\mu|(E)=\sup \left\{\sum_{j=1}^{\infty}\left|\mu\left(E_{j}\right)\right|: E=\bigsqcup_{j=1}^{\infty} E_{j}, \text { each } E_{j} \in \mathcal{B}(G)\right\}
$$

Fact 5.2. If $\mu \in M(G)$ then $|\mu| \in M_{+}(G)$.
Fact 5.3 (Hahn-Jordan decomposition). Each $\mu \in M(G)$ can be written $\mu=\left(\mu_{1}-\mu_{2}\right)+i\left(\mu_{3}-\mu_{4}\right.$ where $\mu_{1}, \ldots, \mu_{4} \in M_{+}(G)$. Furthermore, we can arrange that $\mu_{1} \perp \mu_{2}$ and $\mu_{3} \perp \mu_{4}$ (i.e. $G=E_{1} \sqcup E_{2}$ such that $\mu_{2} \upharpoonright E_{1}=0$ and $\mu_{1} \upharpoonright E_{2}=0$ ), and in this context the decomposition is unique.

Generally we have

$$
\mu_{1}, \ldots, \mu_{4} \leqslant|\mu| \leqslant\left|\mu_{1}-\mu_{2}\right|+\left|\mu_{3}-\mu_{4}\right|
$$

and $\left|\mu_{1}-\mu_{2}\right| \leqslant \mu_{1}+\mu_{2}$, etc. If $\mu_{1} \perp \mu_{2}$ then $\left|\mu_{1}-\mu_{2}\right|=\mu_{1}+\mu_{2}$, etc.
Theorem 5.4 (Riesz representation theorem). Let $C_{0}(G)=\overline{C_{c}(G)}{ }^{\|\cdot\|_{\infty}}$; this is a Banach space. Then $C_{0}(G)^{*} \cong M(G)$ via the pairing

$$
\langle f, \mu\rangle=\mu(f)=\int_{G} f \mathrm{~d} \mu
$$

Furthermore,

$$
\sup \left\{\left|\int_{G} f \mathrm{~d} \mu\right|: f \in C_{0}(G),\|f\|_{\infty} \leqslant 1\right\}=|\mu|(G)
$$

which we define to be $\|\mu\|_{1}$.
Remark 5.5 (Approximation by "compactly supported" measures). Given $\mu \in M(G)$ and $\varepsilon>0$, the inner regularity of $|\mu|$ provides compact $K \subseteq G$ such that $|\mu|(G)<|\mu|(K)+\varepsilon$; thus $|\mu|(G \backslash K)<\varepsilon$. If we let $\mu_{K}: \mathcal{B}(G) \rightarrow \mathbb{C}$ be $\mu_{K}(E)=\mu(E \cap K)$, then

$$
\left\|\mu \mu_{K}\right\|_{1}=\left\|\mu_{G \backslash K}\right\|_{1}=\left|\mu_{G \backslash K}\right|(G)=|\mu|(G \backslash K)<\varepsilon
$$

Theorem 5.6. Given $\mu, \nu \in M(G)$ there is a unique measure $\mu * \nu$ such that for $f \in C_{0}(G)\left(\right.$ or $\left.f \in C_{c}(G)\right)$ we have

$$
\int_{G} f \mathrm{~d}(\mu * \nu)=\int_{G} \int_{G} f(x y) \mathrm{d} \mu(x) \mathrm{d} \nu(y)
$$

Then $(\mu, \nu) \mapsto \mu * \nu$ is bilinear and associative (i.e. $(\mu * \nu) * \rho=\mu *(\nu * \rho)$ where $\rho \in M(G)$ ) and satisfies $\|\mu * \nu\|_{1} \leqslant\|\mu\|_{1}\|\nu\|_{1}$. Hence $(M(G), *)$ is a Banach algebra.

This product is called the convolution product.
Before we begin, we give some facts about the Radon product measure.
Our setup: suppose $X, Y$ are locally compact Hausdorff spaces. We define the product of the Borel $\sigma$-algebras by

$$
\mathcal{B}(X) \otimes \mathcal{B}(Y)=\sigma\langle E \times F: E \in \mathcal{B}(X), F \in \mathcal{B}(Y)\rangle
$$

Clearly $\mathcal{B}(X) \otimes \mathcal{B}(Y) \subseteq \mathcal{B}(X \times Y)$.
A problem: unless both $X$ and $Y$ are separable, we cannot guarantee equality.
Example 5.7. Let $X=Y=\{0,1\}^{I}$ where $|I|>\aleph_{0}$ or $X=Y=\mathbb{R}_{d}$. Nico suspects that $\varsubsetneqq$ holds in both cases.

Theorem 5.8. Given two Radon measures $\mu: \mathcal{B}(X) \rightarrow[0, \infty]$ and $\nu: \mathcal{B}(Y) \rightarrow[0, \infty]$, there is a unique measure $\mu \times \nu$ on $\mathcal{B}(X \times Y)$ such that

$$
\int_{X \times Y} f \mathrm{~d}(\mu \times \nu)=\int_{Y} \int_{X} f(x, y) \mathrm{d} \mu(x) \mathrm{d} \nu(y)=\int_{X} \int_{Y} f(x, y) \mathrm{d} \nu(y) \mathrm{d} \mu(x)
$$

for $f \in C_{c}(X \times Y)$. (We call this the restricted Fubini property $\left(F_{c}\right)$.) This is the unique measure on $\mathcal{B}(X \times Y)$ such that $(\mu \times \nu)(E \times F)=\mu(E) \nu(F)$ for $E \in \mathcal{B}(X)$ and $F \in \mathcal{B}(Y)$. (We call this the product property ( $P$ ).)

We call this the Radon product measure.
Corollary 5.9. If $\mu \in M(X), \nu \in M(Y)$ are complex Radon measures, then there is $\mu \times \nu \in M(X \times Y)$ for which $\left(F_{c}\right)$ and $(P)$ hold.

Fact 5.10 (Fubini for Radon products). For $\mu \in M(X), \nu \in M(Y)$, and $f \in \mathcal{B}^{\infty}(X \times Y)$ (i.e. $f$ is uniformly bounded and Borel measurable), we have that

$$
\begin{aligned}
x & \mapsto \int_{Y} f(x, y) \mathrm{d} \nu(y) \\
y & \mapsto \int_{X} f(x, y) \mathrm{d} \mu(x)
\end{aligned}
$$

are Borel measurable on $X$ and $Y$, respectively, and

$$
\int_{X \times Y} f \mathrm{~d}(\mu \times \nu)=\int_{Y} \int_{X} f(x, y) \mathrm{d} \mu(x) \mathrm{d} \nu(y)=\int_{X} \int_{Y} f(x, y) \mathrm{d} \nu(y) \mathrm{d} \mu(x)
$$

Proof of Theorem 5.6.

1. We define "actions" of $M(G)$ on $C_{c}(G)$. Given $f \in C_{0}(G)$ and $\mu \in M(G)$ we let $f \cdot \mu, \mu \cdot f: G \rightarrow \mathbb{C}$ be

$$
\begin{aligned}
(f \cdot \mu)(x) & =\mu(x \cdot f) \\
& =\int_{G} f(y x) \mathrm{d} \mu(y) \\
(\mu \cdot f)(x) & =\mu(f \cdot x) \\
& =\int_{G} f(x y) \mathrm{d} \mu(y)
\end{aligned}
$$

Let us see that $\mu \cdot f \in C_{0}(G)$. Let $V$ be a neighbourhood of $e$ such that $\left|f(x)-f\left(x^{\prime}\right)\right|<\varepsilon$ if $x^{\prime} x^{-1} \in V$. Then for such $x, x^{\prime}$ we have

$$
\begin{aligned}
\left|(\mu \cdot f)(x)-(\mu \cdot f)\left(x^{\prime}\right)\right| & =\left|\int_{G}\left(f(x y)-f\left(x^{\prime} y\right)\right) \mathrm{d} \mu(x)\right| \\
& \leqslant \int_{G} \underbrace{\left|f(x y)-f\left(x^{\prime} y\right)\right|}_{<\varepsilon} \mathrm{d}|\mu|(y) \\
& \leqslant \varepsilon|\mu|(G)
\end{aligned}
$$

(Note that complex measures are by definition finite.) So $\mu \cdot f$ is continuous. Furthermore, we have

$$
|(\mu \cdot f)(x)| \leqslant \int_{G} \underbrace{|f(x y)|}_{\leqslant\|f\|_{\infty}} \mathrm{d}|\mu|(y) \leqslant\|f\|_{\infty}|\mu|(G)=\|f\|_{\infty}\|\mu\|_{1}
$$

Again, for $\varepsilon>0$, let $K \subseteq G$ be compact and $f^{\prime} \in C_{c}(G)$ satisfy $\left\|\mu-\mu_{K}\right\|_{1}<\varepsilon$ and $\left\|f-f^{\prime}\right\|_{\infty}<\varepsilon$. Then

$$
\begin{aligned}
\left\|\mu \cdot f-\mu_{K} \cdot f^{\prime}\right\|_{\infty} & \leqslant\left\|\mu \cdot f-\mu_{K} \cdot f\right\|_{\infty}+\left\|\mu_{K} \cdot f-\mu_{K} \cdot f^{\prime}\right\|_{\infty} \\
& \leqslant\left\|\mu-\mu_{K}\right\|_{1}\|f\|_{\infty}+\underbrace{\left\|\mu_{K}\right\|_{1}}_{\leqslant\|\mu\|_{1}}\left\|f-f^{\prime}\right\|_{\infty} \\
& <\varepsilon\left(\|f\|_{\infty}-\|\mu\|_{1}\right)
\end{aligned}
$$

It is clear that $\operatorname{supp}\left(\mu_{K} \cdot f^{\prime}\right) \subseteq \operatorname{supp}(f) K^{-1}$; hence $\mu \cdot f \in C_{0}(G)$. The case $f \cdot \mu$ is similar.
2. We check an "associativity": that if $\mu, \nu \in M(G)$ and $f \in C_{0}(G)$, then $\mu \cdot(f \cdot \nu)=(\mu \cdot f) \cdot \nu$.

For $x \in G$ we have

$$
\begin{aligned}
(\mu \cdot(f \cdot \nu))(x) & =\int_{G}(f \cdot \nu)(x y) \mathrm{d} \mu(y) \\
& =\int_{G} \int_{G} f(z x y) \mathrm{d} \nu(z) \mathrm{d} \mu(y) \\
& =\int_{G} \int_{G} f(z x y) \mathrm{d} \mu(y) \mathrm{d} \nu(z) \text { (by Fubini) } \\
& =((\mu \cdot f) \cdot \nu)(x)
\end{aligned}
$$

as desired.
3. We now come to the finale. We define for $\mu, \nu \in M(G)$ and $f \in C_{0}$

$$
\int_{G} f \mathrm{~d}(\mu * \nu)=(\mu * \nu)(f)=\mu \cdot(\nu \cdot f)
$$

(By Riesz representation theorem this specifies $\mu * \nu$.) The map $(\mu, \nu) \mapsto \mu * \nu$ is bilinear and also

$$
|(\mu * \nu)(f)|=|\mu \cdot(\nu \cdot f)| \leqslant\|\mu\|_{1}\|\nu \cdot f\|_{\infty} \leqslant\|\mu\|_{1}\|\nu\|_{1}\|f\|_{\infty}
$$

so it follows that $\mu * \nu$ defines a bounded linear functional on $C_{0}(X)$, and hence an element of $M(G)$ with $\|\mu * \nu\|_{1} \leqslant\|\mu\|_{1}\|\nu\|_{1}$.
It remains to check associativity. Let also $\rho \in M(G)$. We have for $f \in C_{0}(G)$ that

$$
\begin{aligned}
(\mu *(\nu * \rho))(f) & =\int_{G} \int_{G} f(x y) \mathrm{d} \mu(x) \mathrm{d}(\nu * \rho)(y) \\
& =(\nu * \rho)(f \cdot \mu) \\
& =\nu \cdot(\rho \cdot(f \cdot \mu)) \\
& =\nu \cdot((\rho \cdot f) \cdot \mu)(\text { by associativity above }) \\
& =(\mu * \nu)(\pi \cdot f) \\
& =((\mu * \nu) * \rho)(f)
\end{aligned}
$$

as desired.
Theorem 5.6
Remark 5.11.

1. Fix $\nu \in M(G)$. Then both $\mu \mapsto \mu * \nu$ and $\mu \mapsto \nu * \mu$ are weak*-weak* continuous on $M(G) \cong C_{0}(G)^{*}$. Indeed, let $\left.R_{\nu}: C_{0}(G) \rightarrow C_{0} G\right)$ be $R_{\nu}(f)=f \cdot \nu$. Then $\nu * \mu=R_{\nu}^{*}(\mu)$.
2. For $x \in G$ let $\delta_{x}: \mathcal{B}(G) \rightarrow\{0,1\} \subseteq \mathbb{C}$ be given by

$$
\delta_{x}(E)= \begin{cases}1 & \text { if } x \in E \\ 0 & \text { else }\end{cases}
$$

(We call this a Dirac measure.) If $f \in C_{0}(G)$ then $f=f(x) 1_{\{x\}} \delta_{x}$-almost-everywhere. So

$$
\int_{G} f \mathrm{~d} \delta_{x}=f(x)
$$

Then if $x, y \in G$ and $f \in C_{0}(G)$, then

$$
\left(\delta_{x} \delta_{y}\right)(f)=\int_{G} \int_{G} f\left(x^{\prime} y^{\prime}\right) \mathrm{d} \delta_{x}\left(x^{\prime}\right) \mathrm{d} \delta_{y}\left(y^{\prime}\right)=f(x y)=\delta_{x y}(f)
$$

i.e. $\delta_{x} * \delta_{y}=\delta_{x y}$. Also $\delta_{x} \cdot f=x \cdot f$ and $f \cdot \delta_{x}=f \cdot x$.
3. Let $B_{1}^{+}(M(G))=\left\{\mu \in M_{+}(G): \mu(G) \leqslant 1\right\}$.

Exercise 5.12. Thisis a convex set with $\operatorname{Ext}\left(B_{1}^{+}(M(G))\right)=\{0\} \cup\left\{\delta_{x}: x \in G\right\}$.
Then by Krein-Milman theorem, we have that convolution is the unique weak*-weak* continuous product on $M(G)$ satisfying Item 2.

## 6 Atomic/continuous and Lebesgue decompositions

Let $\mu \in M(G)$. Let

$$
A(\mu)=\{x \in G:|\mu|(\{x\})>0\}=\bigcup_{n=1}^{\infty}\left\{x \in G:|\mu|(\{x\})>\frac{1}{n}\right\}
$$

So $A(\mu)$ is countable, and hence Borel. Furthermore, we have

$$
\infty>|\mu|(A(\mu))=\sum_{x \in A(\mu)}|\mu|(\{x\})=\sum_{x \in A(\mu)}|\mu(\{x\})|
$$

It follows that

$$
\mu_{d}=\sum_{x \in A(\mu)} \mu(\{x\}) \delta_{x}
$$

is a measure. We let $\mu_{c}=\mu-\mu_{d}$; so $\mu_{c} \perp \mu_{d}$ (with $G=A(\mu) \sqcup(G \backslash A(\mu))$ ). Hence $\mu=\mu_{d}+\mu_{c}$ and $|\mu|=\left|\mu_{d}\right|+\left|\mu_{c}\right|$; so

$$
\|\mu\|_{1}=|\mu|(G)=\left\|\mu_{d}\right\|_{1}+\left\|\mu_{c}\right\|_{1}
$$

Let

$$
\begin{aligned}
M_{d}(G) & =\overline{\operatorname{span}}\left\{\delta_{x}: x \in G\right\} \\
& \cong \ell^{1}(G) \\
M_{c}(G) & =\{\mu \in M(G): \mu(\{x\})=0 \text { for any } x \in G\}
\end{aligned}
$$

Then $M_{d}(G)$ is a closed subspace and $M_{c}(G)$ is a subspace, which is closed since the defining formula of convolution yields that $\mu \mapsto \mu_{c}$ is a bounded idempotent map on $M(G)$ with range $M_{c}(G)$. We write $M(G)=M_{d}(G) \oplus_{1} M_{c}(G)$ since all $\mu \in M(G)$ admit a decomposition $\mu=\mu_{d}+\mu_{c}$ with $\|\mu\|_{1}=\left\|\mu_{d}\right\|_{1}+\left\|\mu_{c}\right\|_{1}$.

Theorem 6.1 (Lebesgue decomposition). Let $\mu \in M(G)$. We have $\mu=\mu_{s}+\mu_{a}$ where $\mu_{s} \perp m$, $\mu_{a} \ll m$ with $\frac{\mathrm{d} \mu}{\mathrm{d} m}=\frac{\mathrm{d} \mu_{a}}{\mathrm{~d} m} \in L^{1}(G)$. i.e. for $f \in C_{0}(G)$ we have

$$
\int_{G} f \mathrm{~d} \mu=\int_{G} f \mathrm{~d} \mu_{s}+\int_{G} f \frac{\mathrm{~d} \mu_{a}}{\mathrm{~d} m} \mathrm{~d} m
$$

We have $\mu_{s} \perp \mu_{a}$ so $\|\mu\|_{1}=\left\|\mu_{s}\right\|_{1}+\left\|\mu_{a}\right\|_{1}$. Write

$$
M(G)=\underbrace{M_{s}(G)}_{\text {space of singular }} \oplus_{1} \underbrace{M_{a}(G)}_{\text {space of absolutely continuous }}
$$

Suppose $G$ is discrete; then

$$
\left|\mu_{c}\right|(G)=\sup \{\underbrace{\left|\mu_{c}\right|(K)}_{=0}: K \subseteq G \text { compact (hence finite) }\}=0
$$

So $\mu=\mu_{d}$, and $M(G)=M_{d}(G)=\ell^{1}(G)$. One can check that $\ell^{1}(G)=\overline{\operatorname{span}}\left\{\delta_{x}: x \in G\right\}$ is a Banach algebra.
Suppose $G$ is not discrete. Then $m(\{x\})=m(x\{x\})=m(\{e\})=0$. ( $\{e\}$ is a non-open closed set, and hence locally null.) Thus $M_{a}(G) \subseteq M_{c}(G)$. Thus if $\nu \in M_{c}(G)$ we get the Lebesgue decomposition $\nu=\nu_{c s}+\nu_{a}$ with $\nu_{c s} \perp m$ and $\nu_{a} \ll m$.

In summary, if $\mu \in M(G)$, we write

$$
\mu=\mu_{d}+\mu_{c}=\mu_{d}+\mu_{c s}+\mu_{d}
$$

all mutually singular. We then have

$$
M(G)=M_{d}(G) \oplus_{1} \underbrace{M_{c s}(G) \oplus_{1} M_{d}(G)}_{M_{c}(G)} \cong \ell^{1}(G) \oplus_{1} M_{c s}(G) \oplus_{1} L^{1}(G)
$$

Fact 6.2. $M_{d}(G)=\ell^{1}(G)$ is a closed subalgebra.
Question 6.3. What about $M_{c}(G), M_{a}(G) \cong L^{1}(G)$, or $M_{c s}(G)$ ?

## 7 More convolutions

What does $\mu * \nu$ look like as a measure?
Theorem 7.1. If $\mu, \nu \in M(G)$ and $E \in \mathcal{B}(G)$, then $(\mu * \nu)(E)=(\mu \times \nu)\left(\pi^{-1}(E)\right)$, where $\pi: G \times G \rightarrow G$ is the product map.
Remark 7.2.

1. $\pi$ is continuous, and hence Borel measurable; so $\pi^{-1}(E) \in \mathcal{B}(G \times G)$ for $E \in \mathcal{B}(G)$.
2. Fubini's theorem yields that

$$
\begin{aligned}
(\mu \times \nu)\left(\pi^{-1}(E)\right) & =\int_{G \times G} 1_{\pi^{-1}(E)} \mathrm{d}(\mu \times \nu) \\
& =\int_{G \times G} 1_{E} \circ \pi \mathrm{~d}(\mu \times \nu) \\
& =\int_{G \times G} 1_{E}(x y) \mathrm{d}(\mu \times \nu)(x, y) \\
& =\int_{G} \int_{G} 1_{E}(x y) \mathrm{d} \mu(x) \mathrm{d} \nu(y)
\end{aligned}
$$

Proof of Theorem 7.1. We have

$$
\mu=\left(\mu_{0}-\mu_{2}\right)+i\left(\mu_{1}-\mu_{3}\right)=\sum_{k=0}^{3} i^{k} \mu_{k}
$$

where $\mu_{k} \in M_{+}(G)$; likewise for $\nu$. So

$$
\mu * \nu=\sum_{k=0}^{3} \sum_{\ell=0}^{3} i^{k+\ell} \mu_{k} * \nu_{\ell}
$$

We can thus assume that $\mu * \nu \in M_{+}(G)$.

1. Let us first consider compact $K \subseteq G$. Let $\varepsilon>0$; let $U$ be open with $U \supseteq K$ and $(\mu * \nu)(U \backslash K)<\varepsilon$. Let $f \in C_{c}^{[0,1]}(G)$ satisfy $f \upharpoonright K=1$ and $\operatorname{supp}(f) \subseteq U$ (by Urysohn's lemma). Then

$$
\begin{aligned}
(\mu \times \nu)\left(\pi^{-1}(K)\right) & =\int_{G} \int_{G} 1_{K}(x y) \mathrm{d} \mu(x) \mathrm{d} \nu(y) \\
& \leqslant \int_{G} \int_{G} f(x y) \mathrm{d} \mu(x) \mathrm{d} \nu(y) \\
& =\int_{G} f \mathrm{~d}(\mu * \nu) \\
& \leqslant \int_{G} 1_{U} \mathrm{~d}(\mu * \nu) \\
& =(\mu * \nu)(U) \\
& <(\mu * \nu)(K)+\varepsilon
\end{aligned}
$$

Since $\varepsilon$ was arbitrary, we get that

$$
(\mu \times \nu)\left(\pi^{-1}(K)\right) \leqslant(\mu * \nu)(K)
$$

2. Now consider a $(\mu * \nu)$-null set $N \in \mathcal{B}(G)$. If $K \subseteq \pi^{-1}(N) \subseteq G \times G$ is compact, then $\pi(K)$ is compact with $\pi(K) \subseteq N$, and is thus $(\mu * \nu)$-null. Then by Item 1 we have

$$
0 \leqslant(\mu \times \nu)(K) \leqslant(\mu \times \nu)\left(\pi^{-1}(\pi(K))\right) \leqslant(\mu * \nu)(\pi(K))=0
$$

Since Radon measures are inner regular, on bounded sets, we get

$$
(\mu \times \nu)\left(\pi^{-1}(N)\right)=\sup \left\{(\mu \times \nu)(K): K \subseteq \pi^{-1}(N), K \text { compact }\right\}=0
$$

So $\pi^{-1}(N)$ is $(\mu \times \nu)$-null.
3. Suppose $U \subseteq G$ is open. For each $n \in \mathbb{N}$ we can find compact $K_{n} \subseteq U$ so $(\mu * \nu)(U)<(\mu \times \nu)\left(K_{n}\right)+n^{-1}$. Then find $f_{n} \in C_{c}^{[0,1]}(G)$ with $\operatorname{supp}\left(f_{n}\right) \subseteq U$ and $f_{n} \upharpoonright K_{n}=1$; let $g_{n}=\max \left\{f_{1}, \ldots, f_{n}\right\}$. Then $(\mu * \nu)$ -almost-everywhere we have $g_{n} \nearrow 1_{U}$ as $n \rightarrow \infty$. (We let

$$
F=\bigcup_{n=1}^{\infty} K_{n}
$$

so $U \backslash F$ is $(\mu * \nu)$-null, and $g_{n} \rightarrow 1_{U}$ on $F \cup(G \backslash U)$.)
Hence by monotone convergence theorem, using the fact that ( $\mu \times \nu$ )-almost-everywhere we have $g_{n} \circ \pi \nearrow 1_{U} \circ \pi$ (by Item 2), we get that

$$
\begin{aligned}
(\mu \times \nu)\left(\pi^{-1}(U)\right) & =\int_{G \times G} 1_{U} \circ \pi \mathrm{~d}(\mu \times \nu) \\
& =\lim _{n \rightarrow \infty} \int_{G \times G} g_{n} \circ \pi \mathrm{~d}(\mu \times \nu) \\
& =\lim _{n \rightarrow \infty} \int_{G} g_{n} \mathrm{~d}(\mu * \nu) \\
& =\int_{G} 1_{U} \mathrm{~d}(\mu * \nu) \\
& =(\mu * \nu)(U)
\end{aligned}
$$

4. Now let $E \in \mathcal{B}(G)$, and find open $U_{n} v m E$ such that $(\mu * \nu)\left(U_{n} \backslash E\right)<n^{-1}$. Then let

$$
V_{n}=\bigcap_{k=1}^{n} U_{n}
$$

so we have $1_{V_{n}} \rightarrow 1_{E}$ on

$$
\left.G \backslash \bigcap_{n=1}^{\infty} V_{n}\right) \cup E
$$

i.e. $(\mu * \nu)$-almost-everywhere. Hence by Item 2 , we get $(\mu \times \nu)$-almost-everywhere that $1_{V_{n}} \circ \pi \rightarrow 1_{E} \circ \pi$. Thus by Lebesgue dominated convergence theorem we get that

$$
\begin{aligned}
(\mu \times \nu)\left(\pi^{-1}(E)\right) & =\lim _{n \rightarrow \infty} \int_{G \times G} 1_{V_{n}} \circ \pi \mathrm{~d}(\mu * \nu) \\
& =\lim _{n \rightarrow \infty} \int_{G} 1_{V_{n}} \mathrm{~d}(\mu * \nu) \\
& =(\mu * \nu)(E)
\end{aligned}
$$

Remark 7.3. Some consequences:

1. For $\mu, \nu, E$ as above we have

$$
\begin{aligned}
(\mu * \nu)(E) & =\int_{G} \int_{G} 1_{E}(x y) \mathrm{d} \mu(x) \mathrm{d} \nu(y) \\
& =\int_{G} \int_{G} 1_{E y^{-1}}(x) \mathrm{d} \mu(x) \mathrm{d} \nu(y) \\
& =\int_{G} \mu\left(E y^{-1}\right) \mathrm{d} \nu(y)
\end{aligned}
$$

and similarly

$$
(\mu * \nu)(E)=\int_{G} \nu\left(x^{-1} E\right) \mathrm{d} \mu(x)
$$

2. Let

$$
B^{\infty}(G)=\overline{\operatorname{span}\left\{1_{E}: E \in \mathcal{B}(G)\right\}} \|^{\|\cdot\|_{\infty}}=\{\varphi: G \rightarrow \mathbb{C} \mid \varphi \text { bounded and Borel-measurable }\}
$$

By LDCT we have for $\varphi \in B^{\infty}(G)$ that

$$
\int_{G} \varphi \mathrm{~d}(\mu * \nu)=\int_{G \times G} \varphi \circ \pi \mathrm{~d}(\mu \times \nu)=\int_{G} \int_{G} \varphi(x y) \mathrm{d} \mu(x) \mathrm{d} \nu(y)
$$

3. Let $L^{\infty}(G)=B^{\infty}(G) / \mathcal{N}_{m}$, where

$$
\mathcal{N}_{m}=\left\{f \in \mathcal{B}^{\infty}(G): f=0 m \text {-locally-almost-everywhere }\right\}
$$

i.e. if $K \subseteq f^{-1}(\mathbb{C} \backslash\{0\})$ is compact then $m(K)=0$. Then a version of Riesz representation theorem tells us that $L^{1}(G)^{*} \cong L^{\infty}(G)$ via

$$
\langle f, \varphi\rangle=\int_{G} f \varphi \mathrm{~d} m
$$

Corollary 7.4. $M_{c}(G)$ and $M_{a}(G)$ are ideals in $M(G)$.
Proof. If $N \in \mathcal{B}(G)$ an $\mathrm{d} \mu, \nu \in M(G)$, we have

$$
(\mu * \nu)(N)=\int_{G} \mu\left(N y^{-1} \mathrm{~d} \nu(y)=\int_{G} \nu\left(x^{-1} N\right) \mathrm{d} \mu(x)\right.
$$

Suppose one of $\mu, \nu$ lies in $M_{c}(G)$ and $N=\left\{x_{0}\right\}$. Then clearly $(\mu * \nu)\left(\left\{x_{0}\right\}\right)=0$. Thus $\mu * \nu \in M_{c}(G)$.
Likewise if $N$ is $m$-(locally)-null and one of $\mu, \nu$ lies in $M_{a}(G)$, then for $N^{\prime} \subseteq N$ with $N^{\prime} \in \mathcal{B}(G)$ we have for any $x \in G$ that $x^{-1} N^{\prime}, N^{\prime} x^{-1}$ are also $m$-(locally)-null. Thus $(\mu * \nu)\left(N^{\prime}\right)=0$. Thus $\mu * \nu \in M_{a}(G)$.

Remark 7.5. $M_{c s}(G)$ need not be a subalgebra of $M(G)$. Consider $G=K \times K$ for $K$ an infinite compact grape, and $m_{K}$ the normalized Haar measure on $K$. Then one can check that

$$
\left(m_{K} \times \delta_{e}\right) *\left(\delta_{e} \times m_{K}\right)=m_{K} \times m_{K}=m_{G} \ll m_{G}
$$

and $K \times\{e\},\{e\} \times K$ are $m_{G}$-null. So $m_{K} \times \delta_{e}, \delta_{e} \times m_{K} \in M_{c s}(G)$.
Fact 7.6 (Hard). $M_{c s}(\mathbb{R})$ is not a subalgebra of $M(\mathbb{R}) . M_{c s}(\mathbb{T})$ is not a subalgebra of $M(\mathbb{T})$.
Theorem 7.7 (Bochner integral for bounded continuous functions). Suppose $X$ is a locally compact space and $\mathcal{L}$ a Banach space, and let

$$
C_{b}(X, \mathcal{L})=\left\{F: X \rightarrow \mathcal{L} \mid F \text { continuous, }\|f\|_{\infty}=\sup _{x \in X}\|f(x)\|<\infty\right\}
$$

Then there is a bilinear map (integral)

$$
\begin{aligned}
C_{b}(X, G) \times M(X) & \rightarrow \mathcal{L} \\
(F, \mu) & \mapsto \int_{X} F \mathrm{~d} \mu
\end{aligned}
$$

with

$$
\left\|\int_{X} F \mathrm{~d} \mu\right\| \leqslant\|F\|_{\infty}\|\mu\|_{1}
$$

Furthermore if $T \in \mathcal{B}\left(\mathcal{L}, \mathcal{L}^{\prime}\right)$ (bounded linear operator), then

$$
T\left(\int_{X} F \mathrm{~d} \mu\right)=\int_{X} T \circ F \mathrm{~d} \mu
$$

Proof.

1. Let

$$
\mathcal{S}=\mathcal{S}(X, \mathcal{L})=\operatorname{span}\left\{1_{E}(\cdot) \xi: E \in \mathcal{B}(G), \xi \in \mathcal{L}\right\}
$$

Each $\Phi \in \mathcal{S}$ admits a standard form

$$
\Phi=\sum_{j=1}^{n} q_{E_{j}}(\cdot) \xi_{j}
$$

where $\xi_{1}, \ldots, \xi_{n} \in \mathcal{L}$ and $E_{1}, \ldots, E_{n} \in \mathcal{B}(G)$ satisfy $E_{i} \cap E_{j}=\varnothing$ for $i \neq j$. Then $\mathcal{S}$ is a linear space of $\mathcal{L}$-valued functions.
For $\mu \in M(X)$ and $\Phi$ as above, we let

$$
\int_{X} \Phi \mathrm{~d} \mu=\sum_{j=1}^{n} \mu\left(E_{j}\right) \xi_{j}
$$

One checks that this is well-defined, that the map

$$
\begin{aligned}
\mathcal{S} \times M(X) & \rightarrow \mathcal{L} \\
(\Phi, \mu) & \mapsto \int_{X} \Phi \mathrm{~d} \mu
\end{aligned}
$$

is bilinear, that

$$
\left\|\int_{X} \Phi \mathrm{~d} \mu\right\| \leqslant\|\Phi\|_{\infty}\|\mu\|_{1}
$$

and that if $T \in \mathcal{B}\left(\mathcal{L}, \mathcal{L}^{\prime}\right)$ then

$$
T\left(\int_{X} \Phi \mathrm{~d} \mu\right)=\int_{X} T \circ \Phi \mathrm{~d} \mu
$$

2. Let $\overline{\mathcal{S}}=\overline{\mathcal{S}(X, \mathcal{L})}{ }^{\|\cdot\|_{\infty}}$. Hence if $\Psi \in \bar{S}$ then

$$
\Psi=\lim _{n \rightarrow \infty} \Phi_{n}
$$

for some $\left(\Phi_{n}\right)_{n=1}^{\infty}$ in $\mathcal{S}$. Then

$$
\left(\int_{X} \Phi_{n} \mathrm{~d} \mu\right)_{n=1}^{\infty}
$$

is Cauchy in $\mathcal{L}$, and hence has a limit

$$
\int_{X} \Psi \mathrm{~d} \mu
$$

This value is independent of the choice of $\Phi_{n}$; thus the "usual" norm estimate and composition with bounded linear operators holds.
3. Let $K \subseteq X$ be compact. If $F \in C_{b}(X, \mathcal{L})$, then $F(K)$ is compact in $\mathcal{L}$, and hence is totally bounded. i.e. given $\varepsilon>0$ we have

$$
F(K) \subseteq \bigcup_{j=1}^{n} B\left(\xi_{j}, \varepsilon\right)
$$

where $\xi_{1}, \ldots, \xi_{n} \in \mathcal{L}$. Let $E_{1}=F^{-1}\left(B\left(\xi_{1}, \varepsilon\right)\right) \cap K$, and let

$$
E_{j}=F^{-1}\left(B\left(\xi_{j}, \varepsilon\right) \backslash \bigcup_{i=1}^{j-1} B\left(\xi_{i}, \varepsilon\right)\right) \cap K
$$

for $j \in\{2, \ldots, n\}$. Then

$$
\Phi=\sum_{j=1}^{n} 1_{E_{j}}(\cdot) \xi_{j}
$$

and we have

$$
\max _{x \in K}\|F(x)-\Phi(x)\|-\|(F \upharpoonright K)-\Phi\|_{\infty}<\varepsilon
$$

Hence by Item 2 we have

$$
\int_{K} F \mathrm{~d} \mu
$$

is "good".
4. Given $\mu \in M(X)$, find a sequence of compact sets for which

$$
\lim _{n \rightarrow \infty}|\mu|\left(X \backslash K_{n}\right)=0
$$

Given $F \in C_{b}(X, \mathcal{L})$, let

$$
\xi_{n}=\int_{K_{n}} F \mathrm{~d} \mu=\int_{X} F \mathrm{~d} \mu_{K_{n}}
$$

(recall $\mu_{K}(E)=\mu(E \cap K)$ ). Then for $n, m \in \mathbb{N}$ we have

$$
\begin{aligned}
\left\|\xi_{n}-\xi_{m}\right\| & =\left\|\int_{X} F \mathrm{~d}\left(\mu_{K_{n}}-\mu_{K_{m}}\right)\right\| \\
& \leqslant\|F\| \infty\left\|_{\infty} \mu_{K_{n}}-\mu_{K_{m}}\right\| \\
& \leqslant\|F\|_{\infty}|\mu|\left(K_{n} \triangle K_{m}\right) \\
& \leqslant\|F\|_{\infty}\left(|\mu|\left(G \backslash K_{m}\right)+|\mu|\left(G \backslash K_{n}\right)\right)
\end{aligned}
$$

So $\left(\xi_{n}\right)_{n=1}^{\infty}$ is Cauchy in $\mathcal{L}$. We call the limit

$$
\int_{X} F \mathrm{~d} \mu
$$

one checks that this is independent of the sequence $\left(K_{n}\right)_{n=1}^{\infty}$. This integral is "good".Theorem 7.7

Definition 7.8. A Banach space $\mathcal{X}$ is a Banach $G$-module if there is an action

$$
\begin{aligned}
G \times \mathcal{X} & \rightarrow \mathcal{X} \\
(x, \xi) & \mapsto x \cdot \xi
\end{aligned}
$$

such that

- for a fixed $x$ the map $\xi \mapsto x \cdot \xi$ is linear
- there is $C>0$ such that $\|x \cdot \xi\| \leqslant C\|\xi\|$ for all $x, \xi$
- for any fixed $\xi \in \mathcal{X}$ the map $x \mapsto x \cdot \xi$ is a continuous map $G \rightarrow \mathcal{X}$. (Strong operator continuity.)

Theorem 7.9. $\mathcal{X}$ is a Banach $M(G)$-module with the action $(\mu, \xi) \mapsto \mu \cdot \xi$ satisfying

- Bilinearity
- $\|\mu \cdot \xi\| \leqslant C\|\mu\|_{1}\|\xi\|$
- $(\mu * \nu) \cdot \xi=\mu \cdot(\nu \cdot \xi)$.

Proof. Let

$$
\mu \cdot \xi=\int_{G} x \cdot \xi \mathrm{~d} \mu(x)
$$

We us properties of the integral to check the last property. Let $\omega \in \mathcal{X}^{*}$ so $s \mapsto\langle\omega, s \cdot \xi\rangle$ is in $C_{b}(G) \subseteq B^{\infty}(G)$ and we have

$$
\begin{aligned}
\langle\omega,(\mu * \nu) \cdot \xi\rangle & =\int_{G} \int_{G}\langle\omega,(x y) \cdot \xi\rangle \mathrm{d} \nu(x) \mathrm{d} \mu(y) \\
& =\int_{G}\langle\omega, x \cdot \underbrace{\int_{G} y \cdot \xi \mathrm{~d} \nu(y)}_{v \cdot \xi}\rangle \mathrm{d} \mu(x) \\
& =\int_{G}\langle\omega, x \cdot(\nu \cdot \xi)\rangle \mathrm{d} \mu(x) \\
& =\langle\omega, \mu \cdot(\nu \cdot \xi)\rangle
\end{aligned}
$$

(One should check the first equality.) So $(\mu * \nu) \cdot \xi=\mu \cdot(\nu \cdot \xi)$. Theorem 7.9

Recall our notation

$$
\begin{aligned}
& (x * f)(y)=f\left(x^{-1} y\right) \\
& (f * x)(y)=f\left(y x^{-1}\right)(\Delta(x))^{-1}
\end{aligned}
$$

for $m$-almost-every $y$. These make $L^{1}(G)$ both a left and right contractive $G$-module; i.e. $\|x * f\|_{1}=\|f\|_{1}=$ $\|f * x\|_{1}$. Thus we have that $L^{1}(G)$ is a contractive Banach $M(G)$-module with

$$
\begin{aligned}
& \mu * f=\int_{G} x * f \mathrm{~d} \mu(x) \\
& f * \mu=\int_{G} f * x \mathrm{~d} \mu(x)
\end{aligned}
$$

with $\|\mu * f\|_{1} \leqslant\|\mu\|_{1}\|f\|_{1}$ and $\|f * \mu\|_{1} \leqslant\|f\|_{1}\|\mu\|_{1}$.
Recall that $M_{a}(G) \cong L^{1}(G)$ by Radon-Nikodym theorem. (Recall $M_{a}(G)$ is the family of complex measures that are absolutely continuous with respect to $m$; recall further that this is an ideal of $M(G)$.) Thus if $\nu \in M_{a}(G)$ with $\nu \ll m$, say with $\frac{\mathrm{d} \nu}{\mathrm{d} m}=f \in L^{1}(G)$. We write $\nu=f m$; i.e.

$$
(f m)(E)=\int_{E} f \mathrm{~d} m
$$

So for $h \in C_{0}(G)$ we get

$$
\langle f m, h\rangle=\int_{G} h f \mathrm{~d} m
$$

## Proposition 7.10.

1. For $\mu \in M(G)$ and $f \in L^{1}(G)$ (so $f m \in M_{a}(G)$ ), we have

$$
\begin{aligned}
\mu *(f m) & =(\mu * f) m \\
(f m) * \mu & =(f * \mu) m
\end{aligned}
$$

2. For $f, g \in L^{1}(G)$ we define

$$
f * g=(f m) * g=\int_{G} f(x) x * g \mathrm{~d} x
$$

(Bochner integral). Then

$$
f *(g m)=f * g=\int_{G} f * y g(y) \mathrm{d} y
$$

and

$$
(f * g) m=(f m) *(g m)
$$

Proof.

1. If $h \in C_{0}(G)$ we have

$$
\begin{aligned}
\int_{G} h \mathrm{~d}(\mu *(f m)) & =\int_{G} \int_{G} h(x y) \mathrm{d} \mu(x) f(y) \mathrm{d} y \\
& =\int_{G} \int_{G} h(x y) f(y) \mathrm{d} y \mathrm{~d} \mu(y) \text { (Fubini) } \\
& =\int_{G} \int_{G} h(y) f\left(x^{-1} y\right) \mathrm{d} y \mathrm{~d} \mu(y) \\
& =\int_{G} h(y) \int_{G} f\left(x^{-} y\right) \mathrm{d} \mu(x) \mathrm{d} y \text { (Fubini) } \\
& =\int_{G} h \mu * f \mathrm{~d} m
\end{aligned}
$$

and hence $\mu *(f m)=(\mu * f) m$. The rest is similar.
2. Similar.Proposition 7.10

So $\left(L^{1}(G), *\right)$ is a Banach algebra, canonically isomorphic to $M_{a}(G) \triangleleft M(G)$. We call this the ( $L^{1}$-) grape algebra.
Theorem 7.11. Let $\mathcal{X}$ be a non-degenerate Banach $L^{1}(G)$-module; i.e. there is a bilinear map $L^{1}(G) \times \mathcal{X} \rightarrow \mathcal{X}$ written $(f, \xi) \rightarrow f \cdot \xi$ such that

- $\|f \cdot \xi\| \leqslant C\|f\|_{1}\|\xi\|$ (where $C>0$ is independent of $f, \xi$ ).
- $(f * g) \cdot \xi=f \cdot(g \cdot \xi)$.
- $\mathcal{X}_{0}=\operatorname{span}\left\{f \cdot \xi: f \in L^{1}(G), \xi \in \mathcal{X}\right\}$ is dense in $\mathcal{X}$.

Then $\mathcal{X}$ is a Banach G-module.
Proof. Let $\left(f_{\alpha}\right)_{\alpha}$ in $L^{1}(G)$ be a contractive summability kernel. (We'll see these on A2; in particular, we require $\left\|f_{\alpha}\right\|_{1} \leqslant 1$ and

$$
\lim _{\alpha} f_{\alpha} * f=f
$$

for $f \in L^{1}(G)$.) Define an action $G \times \mathcal{X}_{0} \rightarrow \mathcal{X}_{0}$ by

$$
x \cdot\left(\sum_{j=1}^{n} f_{j} \cdot \xi\right)=\sum_{j=1}^{n}\left(x * f_{j}\right) \cdot \xi_{j}
$$

We first check that this is well-defined. It is sufficient to check that if

$$
\sum_{j=1}^{n} f_{j} \cdot \xi_{j}=0
$$

then

$$
\sum_{j=1}^{n}\left(x * f_{j}\right) \cdot \xi_{j}=0
$$

Note, however, that

$$
\begin{aligned}
0 & =\sum_{j=1}^{n} f_{j} \cdot \xi_{j} \\
& =\underbrace{x * f_{\alpha}}_{\in L^{1}(G)} \cdot\left(\sum_{j=1}^{n} f_{j} \cdot \xi_{j}\right) \\
& =\sum_{j=1}^{n}(x * \underbrace{f_{\alpha} * f_{j}}_{\xrightarrow[\alpha]{ } f_{j}}) \\
& \xrightarrow{\alpha} \sum_{j=1}^{n}\left(x * f_{j}\right) \cdot \xi_{j} \\
& =x \cdot\left(\sum_{j=1}^{n} f_{j} \cdot \xi_{j}\right)
\end{aligned}
$$

i.e. $x \cdot 0=0$. Similarly, this action is linear on $\mathcal{X}_{0}$, and is thus well-defined.

Now if

$$
\xi_{0}=\sum_{j=1}^{n} f_{j} \cdot \xi_{j} \in \mathcal{X}_{0}
$$

and $x \in G$ we have

$$
\begin{aligned}
\left\|x \cdot \xi_{0}\right\| & =\left\|\lim _{\alpha} \sum_{j=1}^{n}\left(x * f_{\alpha} * f_{j}\right) \cdot \xi_{j}\right\| \\
& =\lim _{\alpha}\left\|x * f_{\alpha} \cdot \xi_{0}\right\| \\
& \leqslant \limsup _{\alpha}^{C} \underbrace{\left\|x * f_{\alpha}\right\|_{1}}_{\leqslant 1}\left\|\xi_{0}\right\| \\
& \leqslant C\left\|\xi_{0}\right\|
\end{aligned}
$$

Hence if we define $\pi_{0}(x) \in \mathcal{B}\left(\mathcal{X}_{0}\right)$ by $\pi_{0}(x) \xi_{0}=x \cdot \xi_{0}$ for $\xi_{0} \in \mathcal{X}_{0}$, then $\left\{\pi_{0}(x): x \in G\right\}$ is a uniformly bounded family of operators, and hence extends to a uniformly bounded family of operators $\{\pi(x): x \in G\} \subseteq \mathcal{B}(\mathcal{X})$.
We let $x \cdot \xi=\pi(x) \xi$ and $\|x \cdot \xi\| \leqslant\|\pi(x)\|\|\xi\| \leqslant C\|\xi\|$.
It remains to check continuity in $G$. Suppose $\xi \in \mathcal{X}$ and $\varepsilon>0$; pick

$$
\xi_{0}=\sum_{j=1}^{n} f_{j} \cdot \xi_{j} \in \mathcal{X}_{0}
$$

with $\left\|\xi-\xi_{0}\right\|<\varepsilon$. Let $V$ be a neighbourhood of $e$ such that

$$
\left\|x * f_{j}-f_{j}\right\|<\frac{\varepsilon}{n\left(\left\|\xi_{j}\right\|+1\right)}
$$

for $x \in V$. Then for $x \in V$ we have

$$
\begin{aligned}
\|\xi-x \cdot \xi\| & \leqslant\left\|\xi-\xi_{0}\right\|+\left\|\xi_{0}-x \cdot \xi_{0}\right\|+\left\|x \cdot \xi_{0}-x \cdot \xi\right\| \\
& <(1+C) \varepsilon \sum_{j=1}^{n} C\left\|f_{j}-x * f_{j}\right\|_{1}\left\|\xi_{j}\right\| \\
& <(1+2 C) \varepsilon
\end{aligned}
$$

as desired.
Theorem 7.11
Our conclusion: there is a bijective correspondence between Banach $G$-modules and Banach $L^{1}(G)$ modules: given a Banach $G$-module, Theorem 7.9 gives rise to a Banach $M(G)$-module (non-degenerate for $L^{1}(G)$ ), which restricts to a Banach $L^{1}(G) \cong M_{a}(G)$-module, which by the last theorem gives rise to a $G$-module. (We will see on A2 that if $\mathcal{X}$ is a $G$-module then $f_{\alpha} \cdot \xi \xrightarrow{\alpha} \xi$ for $\xi \in \mathcal{X}$, which gives non-degeneracy.) Example 7.12. Consider $M_{c}(G) \triangleleft M(G)$ a closed ideal, with

$$
M(G)=\underbrace{M_{d}(G)}_{\cong \ell^{1}(G)} \oplus_{\ell^{1}} M_{c}(G)
$$

Then $\ell^{1}(G) \cong M(G) / M_{c}(G)$ is a quotient algebra, and hence a Banach $M(G)$-module. Note that

$$
\mu \cdot \delta_{x}=\sum_{y \in A(\mu)} \mu(\{y\}) \delta_{y x}
$$

Since $\left\|\delta_{x}-\delta_{x^{\prime}}\right\|_{1}=1$ for $x \neq x^{\prime}$, this is not a continuous $G$-module.
Theorem 7.13 (Wendel). Suppose $G$ and $H$ are locally compact grapes. If there is an isometric isomorphism $\Phi: L^{1}(G) \rightarrow L^{1}(H)$, then there is a continuous isomorphism $\varphi: G \rightarrow H$ with continuous inverse.

The requirement that $\Phi$ be isometric is important:
Example 7.14. Consider $\mathbb{Z}_{4}$ and $\mathbb{Z}_{2} \times \mathbb{Z}_{2}$. It transpires that $\ell^{1}\left(\mathbb{Z}_{4}\right) \cong \ell^{1}\left(\mathbb{Z}_{2} \times \mathbb{Z}_{2}\right) \cong C(\{1, \ldots, 4\})$ via a non-isometric isomorphism.

Proof of Theorem 7.13. 1. Let

$$
\mathcal{M} L^{1}(G)=\left\{T \in \mathcal{B}\left(L^{1}(G)\right): T(f * g)=T(f) * g \text { for } f, g \in L^{1}(G)\right\}
$$

(Here $\mathcal{B}\left(L^{1}(G)\right)$ refers to bounded linear operators, not Borel sets.)
Claim 7.15. Then $\mathcal{M} L^{1}(G)=\left\{T_{\mu}: \mu \in M(G)\right\}$ where $T_{\mu}(f)=\mu * f$ and $\left\|T_{\mu}\right\|=\|\mu\|_{1}$.
Proof. Suppose $T \in \mathcal{M} L^{1}(G)$, and let $\left(f_{\alpha}\right)_{\alpha}$ be a contractive summability kernel in $L^{1}(G)$. Then $\left(T\left(f_{\alpha}\right)\right)_{\alpha}$ is a bounded net in $L^{1}(G) \hookrightarrow M(G)$, and hence admits a weak*-cluster-point by Banach-Alaoglu. By taking a subnet, we may assume that in the weak*topology we have

$$
\mu=\lim _{\alpha} T\left(f_{\alpha}\right)
$$

Hence in $M(G)$ we have

$$
\begin{aligned}
(\mu * f) m & =\mu *(f m) \\
& =\mathrm{w}^{*}-\lim _{\alpha} T\left(f_{\alpha}\right) *(f m) \\
& =\mathrm{w}^{*}-\lim _{\alpha}\left(T\left(f_{\alpha}\right) * f\right) m \\
& =\mathrm{w}^{*}-\lim _{\alpha} T\left(f_{\alpha} * f\right) m
\end{aligned}
$$

But since $f_{\alpha} * f \xrightarrow{\alpha} f$ in $L^{1}(G)$ and $T$ is bounded (and hence continuous), we have that $T\left(f_{\alpha} * f\right)=T(f)$ in $L^{1}(G)$, so

$$
\lim _{\alpha} T\left(f_{\alpha} * f\right) m=T(f) m
$$

in norm, and in particular in the weak* topology.

TODO 4. Typography
so $\mu * f=T(f)$; i.e. $T=T_{\mu}$.
We have $\left\|T_{\mu}\right\| \leqslant\|\mu\|_{1}$ already. Conversely, we have

$$
\begin{aligned}
\left\|T_{\mu}\right\| & \geqslant \sup _{\alpha}\left\|T_{\mu}\left(f_{\alpha}\right)\right\|_{1} \\
& =\sup _{\alpha}\left\|\mu * f_{\alpha}\right\|_{1} \\
& =\sup _{\alpha} \sup _{h \in C_{0}(G)}\left|\left\langle\mu * f_{\alpha}, h\right\rangle\right| \\
& \geqslant \sup _{\|h\|_{\infty} \leqslant 1} \limsup _{\alpha}|\langle\mu, \underbrace{\left.\lim _{\alpha}\right)}_{\substack{\rightarrow \\
f_{\alpha} \cdot h}}\rangle| \\
& =\sup _{\|h\|_{\infty}}|\langle\mu, h\rangle| \\
& =\|\mu\|_{1}
\end{aligned}
$$

as desired.
2. We define $\widetilde{\Phi}: M(G) \rightarrow M(H)$ by letting $T_{\widetilde{\Phi}(\mu)}=\Phi \circ T_{\mu} \circ \Phi^{-1}$. (Exercise, using Item 1.) Then $\widetilde{\Phi}$ is an isometric isomorphism which is strictly continuous: if $\left(\mu_{\alpha}\right)_{\alpha}$ is a net in $M(G)$ and $\mu \in M(G)$ has

$$
\lim _{\alpha} \mu_{\alpha} * f=\mu * f
$$

for any $f \in L^{1}(G)$, then

$$
\lim _{\alpha} \widetilde{\Phi}\left(\mu_{\alpha}\right) * g=\widetilde{\Phi}(\mu) * g
$$

for any $g \in L^{1}(H)$. Notice that $x_{i} \xrightarrow{i} x$ in $G$ if and only if $\delta_{x_{i}} \xrightarrow{i \text { strict }} \xi_{x}$ in $M(G)$. (Forward direction obvious, reverse an easy exercise.)
3. Let

$$
\widetilde{G}=\operatorname{Ext} \underbrace{B(M(G))}_{\text {closed unit }}=\left\{z \delta_{x}: z \in \mathbb{T}, x \in G\right\}
$$

Then $\widetilde{G}=\mathbb{T} \times G$ (as sets, and by a weak*-homeomorphism). Then $\widetilde{\Phi}$, being a surjective isometry, has

$$
\widetilde{\Phi}(\widetilde{G})=\widetilde{H}=\operatorname{Ext} B(M(H))
$$

(Note that this together with linearity imply that $\varphi$ is surjective.) We define $\zeta: G \rightarrow \mathbb{T}$ and $\varphi: G \rightarrow H$ by

$$
\widetilde{\Phi}\left(\delta_{x}\right)=\zeta(x) \delta_{\varphi(x)}
$$

Then

$$
\zeta(x y) \delta_{\varphi(x y)}=\widetilde{\Phi}\left(\delta_{x y}\right)=\widetilde{\Phi}\left(\delta_{x}\right) \widetilde{\Phi}\left(\delta_{y}\right)=\zeta(x) \zeta(y) \delta_{\varphi(x) \varphi(y)}
$$

So $\zeta(x y) \overline{\zeta(x) \zeta(y)} \delta_{e_{H}}=\delta_{\varphi(x y)^{-1} \varphi(x) \varphi(y)}$. But $\delta_{e_{H}}$ is supported on $\left\{e_{H}\right\}$, and $\delta_{\varphi(x y)^{-1} \varphi(x) \varphi(y)}$ is a probability measure. So $\varphi$ and $\zeta$ are homomorphisms.
Now suppose $x_{i} \xrightarrow{i} x$ in $G$. So $\delta_{x_{i}} \xrightarrow{i, \text { strict }} \delta_{x}$ in $M(G)$. Then

$$
\zeta\left(x_{i}\right) \delta_{\varphi(x)}=\widetilde{\Phi}\left(\delta_{x_{i}}\right) \xrightarrow{i, \text { strict }} \widetilde{\Phi}\left(\delta_{x}\right)=\zeta(x) \delta_{\varphi(x)}
$$

So $\zeta\left(x_{i} x^{-1}\right) \delta_{\varphi\left(x_{i} x^{-1}\right)} \xrightarrow{i, \text { strict }} \delta_{e_{H}}$. We see by taking subsets if we must that 1 is the only cluster point of $\zeta\left(x_{i} x^{-1}\right)$ in $\mathbb{T}$. It follows that $\zeta$ and $\varphi$ are continuous.
4. We check that $\varphi^{-1}: H \rightarrow G$ is continuous. Note that $\Phi^{-1}: L^{1}(H) \rightarrow L^{1}(G)$ gives rise to a continuous homomorphism $\chi: H \rightarrow \mathbb{T}$ and a continuous isomorphism $\varphi: H \rightarrow G$. If $x \in G$ then

$$
\begin{aligned}
\delta_{x} & =\underbrace{\widetilde{\Phi^{-1}}}_{\widetilde{\Phi}^{-1}(\mathrm{check})} \circ \widetilde{\Phi}\left(\delta_{x}\right) \\
& =\widetilde{\Phi}^{-1}\left(\zeta(x) \delta_{\varphi(x)}\right) \\
& =\zeta(x) \widetilde{\Phi}^{-1}\left(\delta_{\varphi(x)}\right) \\
& =\zeta(x) \chi(\varphi(x)) \delta_{\psi(\varphi(x))}
\end{aligned}
$$

We deduce that $(\psi \circ \varphi)(x)=x$. So $\psi \circ \varphi=\mathrm{id}$, and $\psi=\varphi^{-1}$. Theorem 7.13

## 8 Unitary representations

Let $\mathcal{H}$ be a Hilbert space and $U(\mathcal{H})=\left\{U \in \mathcal{B}(\mathcal{H}): U^{*} U=I=U U^{*}\right\}$.
Warning 8.1. In the infinite-dimensional setting, we must check both equalities $U^{*} U=I=U U^{*}$; it's possible for one to be satisfied but not the other.

Notation 8.2. For dual pairings, we will use $\langle\cdot, \cdot\rangle$. For sesquilinear forms, we will use $\langle\cdot \mid \cdot\rangle$. In this class we will use the physics convention: conjugate-linearity in the first argument, and linearity in the second argument.

On $\mathcal{B}(\mathcal{H})$ we consider, in addition to the norm topology, the weak operator topology and the strong operator topology:

$$
\begin{aligned}
\tau_{\mathrm{WO}} & =\sigma(\mathcal{B}(\mathcal{H}),\{T \mapsto\langle\xi, T \eta\rangle: \mathcal{B}(\mathcal{H}) \rightarrow \mathbb{C}, \xi, \eta \in \mathcal{H}\}) \\
\tau_{\mathrm{SO}} & =\sigma(\mathcal{B}(\mathcal{H}),\{T \mapsto T \xi: \mathcal{B}(\mathcal{H}) \rightarrow(H,\|\cdot\|), \xi \in \mathcal{H}\})
\end{aligned}
$$

We have $\tau_{\mathrm{WO}} \subseteq \tau_{\mathrm{SO}}$; i.e. $T_{\alpha} \xrightarrow{\mathrm{SO}, \alpha} T$ implies $T_{\alpha} \xrightarrow{\mathrm{WO}, \alpha} T$.

## Proposition 8.3.

1. The map $B(\mathcal{B}(\mathcal{H})) \times B(\mathcal{B}(\mathcal{H})) \rightarrow B(\mathcal{B}(H))$ (closed unit balls) given by $(S, T) \mapsto S T$ is $\tau_{\mathrm{SO}} \times \tau_{\mathrm{SO}}-\tau_{\mathrm{SO}}$ continuous.
2. On $\mathcal{U}(\mathcal{H})$, the relativized topologies $\tau_{\mathrm{SO}} \upharpoonright \mathcal{U}(\mathcal{H})=\tau_{\mathrm{WO}} \upharpoonright \mathcal{U}(\mathcal{H})$.

Hence $\left(\mathcal{U}(\mathcal{H}), \tau_{\mathrm{WO}}\right)$ is a topological grape.
Proof.

1. Suppose $S_{\alpha} \xrightarrow{\text { SO, } \alpha} S$ and $T_{\alpha} \xrightarrow{\mathrm{SO}, \alpha} T$ in $B(\mathcal{B}(\mathcal{H}))$. Then for $\xi \in \mathcal{H}$ we have

$$
\begin{aligned}
\left\|S_{\alpha} T_{\alpha} \xi-S T \xi\right\| & \leqslant\left\|S_{\alpha} T_{\alpha} \xi-S_{\alpha} T \xi\right\|+\left\|S_{\alpha} T \xi-S T \xi\right\| \\
& \leqslant\left\|T_{\alpha} \xi-T \xi\right\|+\left\|S_{\alpha} T \xi-S T \xi\right\| \\
& \stackrel{\alpha}{\rightarrow} 0
\end{aligned}
$$

2. Suppose $U_{\alpha} \xrightarrow{\text { wo, } \alpha} U$ in $\mathcal{U}(\mathcal{H})$. Then for $\xi \in \mathcal{H}$ we have

$$
\begin{aligned}
\left\|U_{\alpha} \xi-U \xi\right\|^{2} & =\left\langle U_{\alpha} \xi-U \xi \mid U_{\alpha} \xi-U \xi\right\rangle \\
& =2\|\xi\|^{2}-2 \operatorname{Re}\left\langle U_{\alpha} \xi \mid U_{\xi}\right\rangle \\
& \xrightarrow{\alpha} 2\|\xi\|^{2}-2 \operatorname{Re}\langle U \xi \mid U \xi\rangle \\
& =0
\end{aligned}
$$

as desired.

Remark 8.4.

1. The second item fails in $B\left(\mathcal{B}(\mathcal{H})\right.$. Indeed, let $U: \ell^{2}(\mathbb{Z}) \rightarrow \ell^{2}(\mathbb{Z})$ be the bilateral shift $U \delta_{n}=\delta_{n+1}$; so $U \in \mathcal{U}(\mathcal{H}) \subseteq B(\mathcal{B}(\mathcal{H}))$. One can check that $U^{n} \xrightarrow{\text { WO, } n} 0$ while $\left\|U^{n} \xi\right\|=\|\xi\|$ for $\xi \in \ell^{2}(\mathbb{Z})$.
2. The map $(S, T) \mapsto S T$ is not $\left(\tau_{\mathrm{WO}} \times \tau_{\mathrm{WO}}\right)-\tau_{\text {WO }}$ continuous. Let $U$ be as above. So $U^{n}, U^{-n} \xrightarrow{\text { WO, } n} 0$ but $U^{n} U^{-n}=I \xrightarrow{\mathrm{WO}, n} 0$.
3. For a fixed $S$ the maps $T \mapsto T S, T \mapsto S T$, and $T \mapsto T^{*}$ are $\tau_{\text {WO }}-\tau_{\text {WO }}$ continuous. (Check this.)
4. $T \mapsto T^{*}$ is not $\tau_{\text {SO }} \tau_{\text {SO }}$ continuous. (Consider the unilateral shift $S: \ell^{2}(\mathbb{N}) \rightarrow \ell^{2}(\mathbb{N})$ so $S \delta_{n}=S \delta_{n+1}$ Then $\left(S^{*}\right)^{n} \rightarrow 0$ but $S^{n}$ is always an isometry.
Proposition 8.5. $\mathcal{U}(\mathcal{H})$ is the only subgrape of $B(\mathcal{B}(\mathcal{H}))$.
Proof. If $U, U^{-1} \in B(\mathcal{B}(\mathcal{H}))$ then for $\xi \in \mathcal{H}$ we have

$$
\|\xi\|=\left\|U^{-1} U \xi\right\| \leqslant\|U \xi\| \leqslant\|\xi\|
$$

so $\|U \xi\|=\|\xi\|$. hence

$$
\langle\xi \mid \xi\rangle=\|\xi\|^{2}=\|U \xi\|^{2}=\left\langle\xi \mid U^{*} U \xi\right\rangle
$$

where $\left(U^{*} U\right)^{*}=U^{*} U$, so we can use the polarization identity: on any $\xi, \eta \in \mathcal{H}$ we have

$$
4\langle\xi, \eta\rangle=\sum_{k=0}^{3} i^{k}\left\langle\xi+i^{k} \eta \mid \xi+i^{k} \eta\right\rangle=\sum_{k=0}^{3} i^{k}\left\langle\xi+i^{k} \eta \mid U^{*} U\left(\xi+i^{k} \eta\right)\right\rangle=4\left\langle\xi \mid U^{*} U \eta\right\rangle
$$

So $U^{*} U=I$, and $U^{*}=U^{*} U U^{-1}=U^{-1}$. Proposition 8.5

Definition 8.6. A unitary representation is a homomorphism $\pi$ : $G \rightarrow \mathcal{U}(\mathcal{H})$, with $\mathcal{H}$ a Hilbert space, which is $\tau_{G}-\tau_{\text {SO }}$ continuous. (If $x \cdot \xi=\pi(x) \xi$, we get a "unitary" Banach $G$-module.
Theorem 8.7. There is a bijective correspondence between
(i) Unitary representations $\pi: G \rightarrow \mathcal{U}(\mathcal{H})$ with $\mathcal{H}$ a Hilbert space.
( $i^{\prime}$ ) Contractive (i.e. $C=1$ ) Banach $G$-modules on a Hilbert space.
(ii) Non-degenerate $*$-representations $\pi_{1}: L^{1}(G) \rightarrow \mathcal{B}(\mathcal{H})$ with $\mathcal{H}$ a Hilbert space.
(ii') Contractive representations $\pi_{1}: L^{1}(G) \rightarrow \mathcal{B}(\mathcal{H})$ with $\mathcal{H}$ a Hilbert space.
TODO 5. typography
Proof. For $(i) \Longleftrightarrow\left(i^{\prime}\right)$ and $(i i) \Longleftrightarrow\left(i i^{\prime}\right)$, we collect prior propositions on unitaries and the $G$-module to $L^{1}(G)$-module correspondence. It remains to check that $(i) \Longleftrightarrow(i i)$.

If $\pi: G \rightarrow \mathcal{U}(\mathcal{H})$ is a unitary representation, then for $f \in L^{1}(G)$ we let $\pi_{1}(f) \in \mathcal{B}(\mathcal{H})$ be

$$
\pi_{1}(f) \xi=\int_{G} f(x) \pi(x) \xi
$$

(Bochner integral) for $\xi \in \mathcal{H}$. Then for $\xi, \eta \in \mathcal{H}$ we have

$$
\begin{aligned}
\left\langle\pi_{1}(f)^{*} \xi \mid \eta\right\rangle & =\left\langle\xi \mid \pi_{1}(f) \eta\right\rangle \\
& =\int_{G} f(x)\langle\xi \mid \pi(x) \eta\rangle \mathrm{d} x \\
& =\int_{G} f(x)\left\langle\pi \left( x^{-1} \xi|\eta\rangle \mathrm{d} x\right.\right. \\
& =\int_{G} \underbrace{f\left(x^{-1}\right)(\Delta(x))^{-1}}_{\overparen{f^{*}(x)}}\langle\pi(x) \xi \mid \eta\rangle \mathrm{d} x\left(\text { using } \pi\left(x^{-1}\right)=\pi(x)^{*}\right) \\
& =\int_{G}\left\langle f^{*}(x) \pi(x) \xi \mid \eta\right\rangle \mathrm{d} x \\
& =\left\langle\pi_{1}\left(f^{*}\right) \xi \mid \eta\right\rangle
\end{aligned}
$$

So $\pi_{1}(f)^{*}=\pi_{1}\left(f^{*}\right)$. Conversely, if $\pi_{1}: L^{1}(G) \rightarrow \mathcal{U}(\mathcal{H})$ is a $*$-homomorphism and $\left(f_{\alpha}\right)_{\alpha}$ is a summability kernel for $L^{1}(G)$, then $\left(f_{\alpha}^{*}\right)_{\alpha}$ is a summability kernel (check, might be useful on assignment), and we define

$$
\pi(x)^{*}=\text { WO- } \lim _{\alpha} \pi_{1}\left(x * f_{\alpha}\right)^{*}=\text { WO- } \lim _{\alpha} \pi_{1}\left(f_{\alpha}^{*} * x^{-1}\right)=\pi\left(x^{-1}\right)
$$

One should check the first equality.
TODO 6. What?

## 9 Gelfand theory for commutative Banach algebras

Let $\mathcal{A}$ be a commutative Banach algebra: so $\|a b\| \leqslant\|a\|\|b\|$ and $a b=b a$, etc.
Example 9.1.

1. Consider $C_{0}(X)$ where $X$ is a locally compact Hausdorff space. This is unital if and only if $X$ is compact.
2. Consider $\left(L^{1}(G), *\right)$ with $G$ abelian. This is unital if and only if $G$ is discrete (so $L^{1}(G)=\ell^{1}(G)$ ). (For the left-to-right implication, consider the multiplier $T_{f m-\delta_{e}}$ if $f$ is the identity for $L^{1}(G)$. Then $\left\|T_{f m-\delta_{e}}\right\|=\left\|f m-\delta_{e}\right\|_{1}$, and the latter is $\geqslant 1=\left\|\delta_{e}\right\|$ if $G$ is non-discrete, while $T_{f m-\delta_{e}}=0$ if $L^{1}(G)$ is unital.)
3. If $S$ is an abelian semigrape, consider $\left(\ell^{1}(S), *\right)$ with

$$
\sum_{s \in S} a(s) \delta_{s} * \sum_{t \in S} b(t) \delta_{t}=\sum_{u \in S}\left(\sum_{\substack{s, t \in S \times \\ s t=u}} a(s) b(t)\right) \delta_{u}
$$

It is possible for $\ell^{1}(S)$ to be unital, with $S$ being unital.
4. Consider $\mathbb{D}=\{z \in \mathbb{C}:|z|<1\}$ and

$$
\mathcal{A}(\mathbb{D})=\{f \in C(\overline{\mathbb{D}}): f \upharpoonright \mathbb{D} \text { is holomorphic }\}
$$

Definition 9.2. We let the (Gelfand) spectrum of $\mathcal{A}$ be

$$
\widehat{\mathcal{A}}=\{\chi: \mathcal{A} \rightarrow \mathbb{C} \mid \chi \neq 0, \chi \text { linear, } \mathbb{C} \text {-multiplicative }\}
$$

We refer to the elements of $\hat{\mathcal{A}}$ as characters.
We from now on assume that $\mathcal{A}$ is unital.
Proposition 9.3. Let $\mathcal{A}$ be as above and $\chi \in \hat{\mathcal{A}}$. Then

1. $\chi\left(1_{\mathcal{A}}\right)=1$.
2. If $a \in \mathcal{A}^{\times}$(i.e. $a$ is invertible) then $\chi(a) \neq 0$.
3. $|\chi(a)| \leqslant\|a\|$ for $a \in \mathcal{A}$.

Proof.

1. Since $\chi \neq 0$ we have $a$ so $\chi(a) \neq 0$, and $\chi\left(1_{A}\right) \chi(a)=\chi(a)$.
2. We have $1=\chi\left(1_{A}\right)=\chi\left(a a^{-1}\right)=\xi(a) \xi\left(a^{-1}\right)$.
3. If $\lambda \in \mathbb{C}$ with $|\lambda|>\|a\|$ then $\left\|\lambda^{-1} a\right\|<1$, and

$$
\left(\lambda 1_{\mathcal{A}}-a\right)^{-1}=\lambda^{-1}\left(1_{\mathcal{A}}-\lambda^{-1} a\right)^{-1}=\lambda^{-1} \sum_{n=0}^{\infty} \lambda^{-n} a^{n}
$$

(convergence in the Banach space $\mathcal{A})$, so $\chi\left(\lambda 1_{\mathcal{A}}-a\right) \neq 0$. i.e. $\lambda \neq \chi(a)$ if $|\lambda|>\|a\|$. The result follows.

Corollary 9.4. With $\mathcal{A}$ as above we have that $\hat{\mathcal{A}} \subseteq \mathcal{A}^{*}$ is $\mathrm{w}^{*}$--compact.
Proof. Since $\hat{\mathcal{A}} \subseteq B\left(\mathcal{A}^{*}\right)$, it suffices to show that $\hat{A}$ is w*--closed (by Banach-Alaoglu). If $\left(\chi_{\alpha}\right)_{\alpha}$ is a net in $\hat{\mathcal{A}}$ with $\chi_{\alpha} \xrightarrow{\mathrm{w}^{*}, \alpha} \chi$, then for $a, b \in \mathcal{A}$ we have

$$
\chi(a b)=\lim _{\alpha} \chi(a b)=\lim _{\alpha} \chi_{\alpha}(a) \chi_{\alpha}(b)=\chi(a) \chi(b)
$$

and

$$
1=\lim _{\alpha} \chi_{\alpha}\left(1_{\mathcal{A}}\right)=\chi\left(1_{\mathcal{A}}\right)
$$

so $\chi \neq 0$.Corollary 9.4

Lemma 9.5. Suppose $\mathcal{A}$ is as above and $\mathcal{I} \varsubsetneqq \mathcal{A}$ is an ideal. Then

1. $\mathcal{I} \cap \mathcal{A}^{\times}=\varnothing$.
2. $\overline{\mathcal{I}} \varsubsetneqq \mathcal{A}$ and is also an ideal.
3. $\mathcal{I}$ is contained in a maximal ideal $\mathcal{I} \subseteq \mathcal{M} \varsubsetneqq \mathcal{A}$.
4. If $\mathcal{I}$ is maximal then it is closed.

Proof.

1. If $a \in \mathcal{A}^{\times}$then $1_{\mathcal{A}} \in a \mathcal{A}$, so $a \notin \mathcal{I}$.
2. If $\|b\|<1$ in $\mathcal{A}$ then $1-b \in \mathcal{A}^{*}$. Indeed,

$$
(1-b)^{-1}=\sum_{n=0}^{\infty} b^{n}
$$

so the open set $U=\left\{a \in \mathcal{A}:\left\|a-1_{\mathcal{A}}\right\|<1\right\} \subseteq \mathcal{A}^{\times}$. Then $\mathcal{I} \cap U=\varnothing$, hence $\bar{I} \cap U=\varnothing$, and $\overline{\mathcal{I}} \varsubsetneqq \mathcal{A}$. Also if

$$
a=\lim _{n \rightarrow \infty} a_{n}
$$

for $a_{n} \in \mathcal{I}$ and $b \in \mathcal{A}$ then

$$
b a=\lim _{n \rightarrow \infty} b a_{n} \in \overline{\mathcal{I}}
$$

So $\mathcal{I}$ is an ideal.
3. Let $\Xi=\{\mathcal{J} \varsubsetneqq \mathcal{A}: \mathcal{J}$ an ideal, $\mathcal{I} \subseteq \mathcal{J}\}$. Then $\Xi$ is partially ordered by inclusion. If $\Gamma \subseteq \Xi$ is a chain then

$$
\mathcal{K}=\bigcup_{\mathcal{J} \in \Gamma} \mathcal{J} \in \Xi
$$

(using (1.)), and $\mathcal{K}$ is an upper bound for $\Gamma$. By Zorn's lemma we are done.
4. We use (2.) and maximality.

## Theorem 9.6.

1. If $a \in \mathcal{A}$ then $\sigma(a)=\left\{\lambda \in \mathbb{C}: \lambda 1-a \notin \mathcal{A}^{\times}\right\} \neq \varnothing$.
2. (Gelfand-Mazur) If a (commutative, unital) Banach algebra is a division ring, then $\mathcal{A}=\mathbb{C} 1_{\mathcal{A}}$.

Proof.

1. This is done exactly as in the case $\mathcal{B}(\mathcal{X})$ (bounded operators on $\mathcal{X}$ ).
2. If there were $a \in \mathcal{A} \backslash \mathbb{C} 1_{\mathcal{A}}$, then $\lambda 1-a \notin \mathcal{A}^{\times}$for all $\lambda \in \mathbb{C}$, contradicting the first point.Theorem 9.6

Theorem 9.7. If $\mathcal{A}$ is a unital commutative Banach algebra, then its set of distinct maximal ideals is $\{\operatorname{ker}(\chi): \chi \in \hat{\mathcal{A}}\}$. (i.e. if $\chi_{1} \neq \chi_{2}$ then $\operatorname{ker}\left(\chi_{1}\right) \neq \operatorname{ker}\left(\chi_{2}\right)$.)
Proof. Since $\mathcal{A} / \operatorname{ker}(\chi) \cong \mathbb{C}$ is a field, each $\operatorname{ker}\left(\chi\right.$ is a maximal ideal. If $\operatorname{ker}(\chi)=\operatorname{ker}\left(\chi^{\prime}\right)$ then for any $a \in \mathcal{A}$ we have

$$
\chi(a) 1_{\mathcal{A}}-a \in \operatorname{ker}(\chi)=\operatorname{ker}\left(\chi^{\prime}\right)
$$

so

$$
\chi^{\prime}(a)=\chi^{\prime}\left(\chi(a) 1_{\mathcal{A}}-\left(\chi(a)_{\mathcal{A}}-a\right)\right)=\chi(a)
$$

so $\chi=\chi^{\prime}$.
If $\mathcal{M}$ is a maximal ideal of $\mathcal{A}$ then $\mathcal{A} / \mathcal{M}$ (with quotient norm

$$
\|a+\mathcal{M}\|=\inf _{b \in \mathcal{M}}\|a-b\|
$$

which one should check forms a Banach algebra) admits no proper ideals. Indeed, if $\mathcal{J} \varsubsetneqq \mathcal{A} / \mathcal{M}$ is an ideal, then $\mathcal{M} \subseteq q^{-1}(\mathcal{J}) \varsubsetneqq \mathcal{A}$ (where $q: \mathcal{A} \rightarrow \mathcal{A} / \mathcal{M}$ is the quotient map) and $q^{-1}(\mathcal{J})$ is an ideal, so $q^{-1}(\mathcal{J})=\mathcal{M}$, and $\mathcal{J}=\{0+\mathcal{M}\}$. Thus for $a \in \mathcal{A} \backslash \mathcal{M}$ we have

$$
1_{\mathcal{A}}+\mathcal{M} \in \underbrace{(a+\mathcal{M}) \cdot(\mathcal{A} / \mathcal{M})}_{\text {principal ideal }}
$$

and $a+\mathcal{M} \in(\mathcal{A} / \mathcal{M})^{\times}$. By the Gelfand-Mazur theorem, we have $\mathcal{A} / \mathcal{M}=\mathbb{C}\left(1_{\mathcal{A}}+\mathcal{M}\right)$. Let $\chi: \mathcal{A} \rightarrow \mathbb{C}$ be given by $\chi(a)\left(1_{\mathcal{A}}+\mathcal{M}\right)=a+\mathcal{M}$. Then $\chi \in \widehat{\mathcal{A}}$ and $\mathcal{M}=\operatorname{ker}(\chi)$.

## Corollary 9.8.

1. We have

$$
\mathcal{A} \backslash \mathcal{A}^{\times}=\bigcup_{x \in \hat{\mathcal{A}}} \operatorname{ker} \chi
$$

2. If $a \in \mathcal{A}$ then

$$
\sup _{\chi \in \widehat{\mathcal{A}}}|\chi(a)|=\lim _{n \rightarrow \infty}\left\|a^{n}\right\|^{\frac{1}{n}}
$$

Proof.

1. If $a \in \mathcal{A}^{\times}$, we already saw that

$$
a \in \mathcal{A} \backslash \bigcup_{x \in \widehat{\mathcal{A}}} \operatorname{ker}(\chi)
$$

If $a \in \mathcal{A} \backslash \mathcal{A}^{\times}$then $a \mathcal{A}$ is a proper ideal, and hence is contained in a maximal ideal $\operatorname{ker}(\chi)$.
2. Let $\lambda \in \mathbb{C}$ and $a \in \mathcal{A}$. Then

$$
\begin{aligned}
\lambda \in \sigma(a) & \Longleftrightarrow \lambda 1_{\mathcal{A}}-a \in \mathcal{A} \backslash \mathcal{A}^{\times} \\
& \Longleftrightarrow \lambda_{\mathcal{A}}-a \in \operatorname{ker}(\chi) \text { for some } \chi \in \hat{\mathcal{A}} \\
& \Longleftrightarrow \lambda=\chi(a)
\end{aligned}
$$

Hence

$$
\sup _{\chi \in \hat{\mathcal{A}}}|\chi(a)|=\max _{\lambda \in \sigma(a)}|\lambda|=\lim _{n \rightarrow \infty}\left\|a^{n}\right\|^{\frac{1}{n}}
$$

by Beurling's spectral radius formula.
Corollary 9.8

## 10 Abelian harmonic analysis

Let $G$ be a locally compact abelian grape.
Remark 10.1. Both $L^{1}(G)$ and $M(G)$ are abelian Banach algebras. (Indeed we have

$$
\int_{G} h \mathrm{~d}(\mu * \nu)=\int_{G} \int_{G} h(x y) \mathrm{d} \mu(x) \mathrm{d} \nu(y)
$$

at which point we can apply Fubini-Tonelli.)
Proposition 10.2. Suppose $\tau: G \rightarrow \mathbb{C}^{\times}$is a continuous homomorphism. Then

1. $\tau=|\tau| \sigma$ where $\sigma: G \rightarrow \mathbb{T}$ is a continuous homomorphism.
2. $\tau$ is bounded if and only if $\tau(G) \subseteq \mathbb{T}$.
3. The set $\widehat{G}=\{\sigma: G \rightarrow \mathbb{T} \mid \sigma$ a continuous homomorphism $\}$ is a grape under pointwise operations.

Proof.

1. We let

$$
\sigma(x)=\frac{\tau(x)}{|\tau(x)|}
$$

for $x \in G$.
2. We have $|\tau|(G) \subseteq(0, \infty)$. Then $\tau$ is bounded if and only if $|\tau|(G)=\{1\}$.
3. Obvious. Notice that $\sigma^{-1}=\bar{\sigma}$ (pointwise conjugation).
$\square$ Proposition 10.2
Definition 10.3. We call $\hat{G}$ the dual grape of $G$.
Theorem 10.4. We have

1. $\widehat{L^{1}(G)}=\left\{\chi_{\sigma}: \sigma \in \widehat{G}\right\}$ where

$$
\chi_{\sigma}(f)=\int_{G} f \sigma \mathrm{~d} m
$$

(Recall $\widehat{L^{1}(G)}$ is the Gelfand spectrum.) Note that $\widehat{G} \subseteq C_{b}(G) \subseteq L^{\infty}(G)$.
2. $\hat{G} \cup\{0\}$ is $a \mathrm{w}^{*}$ - compact set in $L^{\infty}(G)$, and hence $\hat{G}$ is $\mathrm{w}^{*}$ - locally compact.
3. $\left(\widehat{G}, \mathrm{w}^{*}\right)$ is a locally compact grape.

## Proof.

1. Let

$$
\mathcal{A}= \begin{cases}L^{1}(G)=\ell^{1}(G) & \text { if } G \text { discrete } \\ L^{1}(G) \oplus \ell^{1} \mathbb{C} \delta_{e} \hookrightarrow \mathcal{M}(G) & \text { else }\end{cases}
$$

If $\chi \in \widehat{L^{1}(G)}$, define $\tilde{\chi}: \mathcal{A} \rightarrow \mathbb{C}$ by $\tilde{\chi}\left(f+\lambda \delta_{e}\right)=\chi(f)+\lambda$ and $\tilde{\chi} \in \widehat{\mathcal{A}}$. Hence $\|\tilde{\chi}\| \leqslant 1$, so $\|\chi\|=$ $\left\|\tilde{\chi} \mid L^{1}(G)\right\| \leqslant 1$, and in particular $\chi$ is bounded.
We fix $\chi \in \widehat{L^{(G)}}$ and let $f, g \in L^{1}(G)$ with $\chi(f), \chi(g) \neq 0$. Then for $x \in G$ we have

$$
\chi(x * f) \chi(g)=\chi(x * f * g)=\chi(x * g * f)=\chi(x * g) \chi(f)
$$

Hence

$$
\sigma(x)=\frac{\chi(x * f)}{\chi(f)}
$$

is independent of $f \in L^{1}(G) \backslash \operatorname{ker}(\chi)$. Notice that $\sigma$ is bounded in $x$ :

$$
|\sigma(x)|=\frac{|\chi(x * f)|}{|\chi(f)|} \leqslant \frac{\|x * f\|_{1}}{|\chi(f)|}=\frac{\|f\|_{1}}{|\chi(f)|}
$$

and $\sigma$ is continuous as the map $G \rightarrow L^{1}(G)$ given by $x \mapsto x * f$ is continuous.
If $x, y \in G$ and $f \in L^{1}(G) \backslash \operatorname{ker}(\chi)$ then $\chi(f * f)=\chi(f)^{2} \neq 0$, so

$$
\sigma(x y)=\frac{\chi(x * y * f * f)}{\chi(f * f)}=\frac{\chi(x * f * y * f)}{\chi(f)^{2}}=\sigma(x) \sigma(y)
$$

so $\sigma: G \rightarrow \mathbb{C}^{\times}$is a bounded homomorphism, and $\sigma \in \widehat{G}$.
Notice that if $\sigma \neq \tau$ in $\widehat{G}$ then $\{x \in G: \sigma(x) \neq \tau(x)\}$ is open in $G$, and hence not locally $m$-null, and $\chi_{\sigma} \neq \chi_{\tau}$.
Finally, notice that for $g \in L^{1}(G)$ we have

$$
\chi_{\sigma}(g)=\int_{G} g \sigma \mathrm{~d} m=\int_{G} g(x) \frac{\chi(x * f)}{\chi(f)} \mathrm{d} x=\frac{1}{\chi(f)} \chi(\underbrace{\int_{G} g(x) x * f \mathrm{~d} y}_{g * f})=\chi(g)
$$

2. By Banach-Alaoglu it suffices to show that $\widehat{G} \cup\{0\} \subseteq B\left(L^{\infty}(G)\right)$ is $\mathrm{w}^{*}$-closed. If $\left(\sigma_{\alpha}\right)_{\alpha}$ is a net in $\widehat{G} \cup\{0\}$ converging to $\sigma \in B\left(L^{\infty}(G)\right)$, we can see for $f, g \in L^{1}(G)$ that

$$
\langle f * g, \sigma\rangle=\lim _{\alpha}\left\langle f * g, \sigma_{\alpha}\right\rangle=\lim _{\alpha}\left\langle f, \sigma_{\alpha}\right\rangle\left\langle g, \sigma_{\alpha}\right\rangle=\langle f, \sigma\rangle\langle g, \sigma\rangle
$$

so $\sigma \in \widehat{G} \cup\{0\}$. (Note that if $\tau \in \widehat{G}$ then

$$
\langle f * g, \tau\rangle=\int_{G} \int_{G} f(x) g\left(x^{-1} y\right) \tau(y) \mathrm{d} x \mathrm{~d} y=\int_{g} \int_{G} f(x) g(y) \tau(x y) \mathrm{d} x \mathrm{~d} y=\langle f, \tau\rangle\langle g, \tau\rangle
$$

which yields the desired result.)
If $\sigma \in \widehat{G}$ then since the weak*-topology is Hausdorff, there is a ${ }^{*}$-openset $W$ containing $\sigma$ such that $0 \notin \bar{W}$. But $\bar{W} \cap \widehat{G}=\bar{W} \cap(\widehat{G} \cup\{0\})$ is compact.
3. Let $M: L^{\infty}(G) \rightarrow \mathcal{B}\left(L^{2}(G)\right)$ (bounded linear operators) be given by $M(\varphi) \xi=\varphi \cdot \xi$ ( $m$-almost-everywhere pointwise multiplication). Then for $\xi, \eta \in L^{2}(G)$ we have

$$
\langle\xi \mid M(\varphi) \eta\rangle=\int_{G} \varphi \underbrace{\bar{\xi} \eta}_{\substack{\in L^{1}(G), \\ \text { Cauchy-Schwarz }}} \mathrm{d} m
$$

Also, if $f \in L^{1}(G)$, then

$$
\left.\langle\varphi, f\rangle=\int_{G} \varphi f \mathrm{~d} m=\left.\left.\langle\overline{\operatorname{sgn}} f \cdot| f\right|^{\frac{1}{2}}|M(\varphi)| f\right|^{\frac{1}{2}}\right\rangle
$$

Hence $M$ is a w*-WO homeomorphism onto its range; i.e. $\varphi_{\alpha} \xrightarrow{\mathrm{w}^{*}, \alpha}$ in $L^{\infty}(G)$ if and only if $M\left(\varphi_{\alpha}\right) \xrightarrow{\text { wo, } \alpha}$ $M(\varphi)$ in $M\left(L^{\infty}(G)\right)$. Now, since for $\sigma \in \widehat{G}$ we have $\sigma(G) \subseteq \mathbb{T}$ we see that $M(\sigma) \in U\left(L^{2}(G)\right)$. (One checks that $M(\bar{\varphi})=M(\varphi)^{*}$. Hence $M \upharpoonright \widehat{G}: \widehat{G} \rightarrow M(\widehat{G}) \subseteq U\left(L^{2}(G)\right)$ is a $\mathrm{w}^{*}$-WO homeomorphism. The result then follows.

## Proposition 10.5.

1. If $G$ is discrete, then $\hat{G}$ is compact.
2. If $G$ is compact, then $\widehat{G}$ is discrete.

Proof.

1. $L^{1}(G)=\ell^{1}(G)$ is unital, so $\widehat{G} \cong \widehat{\ell^{1}(G)}$ is compact.
2. We normalize $m$ so $m(G)=1$. if $\sigma \in \widehat{G} \backslash\{1\}$, then there is $y \in G$ with $\sigma(y) \neq 1$. hence

$$
\int_{G} \sigma(x) \mathrm{d} x=\int_{G} \sigma(y x) \mathrm{d} x=\sigma(y) \int_{G} \sigma(x) \mathrm{d} x
$$

and hence

$$
\int_{G} \sigma(x) \mathrm{d} x=0
$$

Clearly

$$
\int_{G} 1(x) \mathrm{d} x=1
$$

Hence

$$
\{\tau \in \widehat{G}:|\langle\tau, 1\rangle-\underbrace{\langle 1,1\rangle}_{1}|<\frac{1}{2}\}
$$

is a $\mathrm{w}^{*}$-open neighbourhood of 1 and equals 1 . Thus $\widehat{G}$ is discrete.
$\square$ Proposition 10.5
Example 10.6.

1. Consider $G=\mathbb{Z}$; we use additive notation. if $\sigma \in \widehat{\mathbb{Z}}$, let $z=\sigma(1)$ (where 1 is the generator of $\mathbb{Z}$, not its identity). Then for $n \in \mathbb{Z}$ we have $\sigma(n)=z^{n}$. Write $\sigma=\sigma_{z}$. Clearly for any $z \in \mathbb{T}$ we have $\sigma_{z}$ defines an element of $\widehat{\mathbb{Z}}$. Thus $\widehat{\mathbb{Z}}=\left\{\sigma_{z}: z \in \mathbb{T}\right\}$, and if $z \neq z^{\prime}$ then $\sigma_{z} \neq \sigma_{z^{\prime}}$.
Let us consider a $\mathrm{w}^{*}$-open neighbourhood of $1=\sigma_{1} \in \widehat{\mathbb{Z}}$

$$
U=\bigcap_{k=-n}^{n}\left\{\sigma_{z} \in \widehat{\mathbb{Z}}:\left|\left\langle\sigma_{z}, \delta_{k}\right\rangle-\left\langle\sigma_{z}, \delta_{0}\right\rangle\right|<1\right\}=\bigcap_{k=-n}^{n}\left\{\sigma \in \widehat{\mathbb{Z}}:\left|z^{k}-1\right|<1\right\}
$$

Write $z=\exp (i t)$ for $-\pi<t \leqslant \pi$. For $k \in\{-n, \ldots, n\}$ we have

$$
1>\left|z^{k}-1\right|^{2}=|\exp (i k t)-1|^{2}=2-2 \cos (k t)
$$

So $\cos (k t)>\frac{1}{2}$ and $k t \in\left(-\frac{\pi}{3}, \frac{\pi}{3}\right)$ (modulo $2 \pi$ ). Hence $U=\left\{\exp (i t): t \in\left(-\frac{\pi}{3 n}, \frac{\pi}{3 n}\right)\right\}$. Hence a $\mathrm{w}^{*}$-neighbourhood of $\sigma_{1}$ in $\widehat{\mathbb{Z}}$ is a neighbourhood base of 1 in $\mathbb{T}$. Thus $\mathbb{T} \cong\left\{\sigma_{z}: z \in \mathbb{T}\right\}$ has an induced $w^{*}$-topology finer than the ambient topology. On sets, comparable compact Hausdorff topologies coincide.
2. Consider $G=\mathbb{R}$. Suppose $\sigma \in \widehat{\mathbb{R}}$. Then $\sigma$ is continuous with $\sigma(0)=1$, so there is $\alpha>0$ so

$$
\int_{0}^{\alpha} \sigma(x) \mathrm{d} x \neq 0
$$

Now if $y \in \mathbb{R}$ then

$$
\sigma(y) \int_{0}^{\alpha} \sigma(x) \mathrm{d} x=\int_{0}^{\alpha} \sigma(y+x) \mathrm{d} x=\int_{-y}^{\alpha-y} \sigma(x) \mathrm{d} x
$$

The fundamental theorem of calculus then tells us that $\sigma$ is differentiable. Now, for $x \in \mathbb{R}$ we have

$$
\sigma^{\prime}(x)=\lim _{h \rightarrow 0} \frac{\sigma(x+h)-\sigma(x)}{h}=\sigma(x) \lim _{h \rightarrow 0} \frac{\sigma(h)-\sigma(0)}{h}=\sigma(x) \sigma^{\prime}(0)
$$

Let $f(x)=\exp \left(-\sigma^{\prime}(0) x\right) \sigma(x)$. Then $f(0)=1$ and $f^{\prime}(x)=0$ (product rule) so by the mean value theorem we have $f(x)=1$ for all $x$; i.e. $\sigma(x)=\exp (z x)$ (where $z \in \mathbb{C}$ ). Moreover $\sigma(\mathbb{R}) \subseteq \mathbb{T}$, so $a=i s$ for $s \in \mathbb{R}$. Let $\sigma=\sigma_{s}$, where $\sigma_{s}(x)=\exp (i s x)$. Clearly $s \neq t$ in $\mathbb{R}$, so $\sigma_{s} \neq \sigma_{t}$, and $\sigma_{s} \in \widehat{\mathbb{R}}$.
Consider a $\mathrm{w}^{*}$-open neighbourhood of $\sigma_{0}$ :

$$
\begin{aligned}
U_{a, \varepsilon} & =\left\{\sigma_{\epsilon} \widehat{\mathbb{R}}:\left|\left\langle\sigma_{s}, 1_{[-a, a]}\right\rangle-\left\langle\sigma_{0}, 1_{[-a, a]}\right\rangle\right|<\varepsilon\right\} \\
& =\left\{\sigma_{s} \in \widehat{\mathbb{R}}:\left|\int_{-a}^{a}(\exp (i s x)-1) \mathrm{d} x\right|<\varepsilon\right\} \\
& =\{\sigma_{s} \in \widehat{\mathbb{R}}: 2|\underbrace{\frac{\sin (a s)}{s}-a}_{\psi_{a}(s)}|^{<\varepsilon}\}
\end{aligned}
$$

where $\psi_{a}$ is an analytic and hence continuous function. Also

$$
\lim _{s \rightarrow \pm \infty}\left|\psi_{a}(s)\right|=|a|
$$

and

$$
\lim _{a \rightarrow \infty} \psi_{a}(s)=\infty
$$

We conclude that $\left\{U_{a, \varepsilon}: a>0, \varepsilon>0\right\}$ is a usual neighbourhood basis of 0 in $\mathbb{R}$. Hence the weak* topology is finer than the ambient topology. But

$$
\mathrm{w}^{*}-\lim _{s \rightarrow t} \sigma_{s}=\sigma_{t}
$$

(easy exercise). So the weak* topology is coarser than the ambient topology. So

$$
\widehat{\mathbb{R}}=\left\{\sigma_{s}: s \in \mathbb{R}\right\} \cong \mathbb{R}
$$

as locally compact grapes.
3. Consdier $G=\mathbb{T}$. Consider $\sigma_{1}: \mathbb{R} \rightarrow \mathbb{T}$ with $\sigma_{1}(t)=\exp (i t)$; so $\operatorname{ker}\left(\sigma_{1}\right)=2 \pi \mathbb{Z}$. If $\tau \in \widehat{\mathbb{T}}$ then $\tau \circ \sigma_{1} \in \widehat{\mathbb{R}}$ so $\tau \circ \sigma_{1}(x)=\exp (i s x)$ for some $s \in \mathbb{R}$, with $1=\tau \circ \sigma_{1}(2 \pi)=\exp (i 2 \pi s)$, so $s=n \in \mathbb{Z}$. Hence $\tau \circ \sigma_{1}(x)=\exp ($ ixn $)=\sigma_{1}(x)^{n}$ for $x \in \mathbb{R}$. Hence $\widehat{\mathbb{T}}=\left\{z \mapsto z^{n}: n \in \mathbb{Z}\right\}$. The topology is discrete.

Suppose $\mathcal{A}$ is a commutative unital Banach algebra; e.g. $\mathcal{A}=L^{1}(G)+\mathbb{C} \delta_{e} \subseteq M(G)$. Recall Beurling's spectral radius formula:

$$
\sup _{\chi \in \hat{\mathcal{A}}}\|\chi(a)\|=\lim _{n \rightarrow \infty}\left\|a^{n}\right\|^{\frac{1}{n}} \leqslant\|a\|
$$

Definition 10.7. For $f \in L^{1}(G)$ we define the Fourier transform of $f$ to be $\widehat{f}: \widehat{G} \rightarrow \mathbb{C}$ given by

$$
\widehat{f}(\sigma)=\int_{G} f \bar{\sigma} \mathrm{~d} m
$$

Theorem 10.8 (Riemann-Lebesgue, Gelfand). The map $L^{1}(G) \rightarrow C_{0}(\widehat{G})$ given by $f \mapsto \widehat{f}$ is a homomorphism with

1. $\|\widehat{f}\|_{\infty}=\lim _{n \rightarrow \infty}\left\|f^{* n}\right\|_{1}^{\frac{1}{n}} \leqslant\|f\|_{1}$.
2. $A(\widehat{G})=\left\{\widehat{f}: f \in L^{1}(G)\right\}$ is dense in $C_{0}(\widehat{G})$.

Proof. We recall that $\widehat{G} \cup\{0\}$ is compact. We have that $\widehat{f}(\sigma)=\chi_{\bar{\sigma}}(f)$ is continuous in $\sigma$ as $\widehat{G}$ has the weak* topology. If we let $\widehat{f}(0)=0$, then $\widehat{f}$ is continuous on $\widehat{G} \cup\{0\}$ (from the proof of a previous theorem)
TODO 7. which
Hence $\hat{f} \in C_{0}(\hat{G})$. We now verify the required conditions.

1. This is simply Beurling's spectral radius formula.
2. We notice that $A(\widehat{G})$ is point-separating on $\widehat{G}$. (If $\sigma \neq \tau$ in $\widehat{G}$ then $\chi_{\bar{\sigma}} \neq \chi_{\bar{\tau}}$, so there is $f \in L^{1}(G)$ with

$$
\widehat{f}(\sigma)=\chi_{\bar{\sigma}}(f) \neq \chi_{\bar{\tau}}(f)=\widehat{f}(\tau)
$$

Since $f \mapsto \hat{f}$ is (almost) the Gelfand transform, we get that $f \mapsto \hat{f}$ is multiplicative, so $A(\hat{G})$ is a subalgebra. We also have for $f \in L^{1}(G)$ and $\sigma \in \widehat{G}$ that

$$
\widehat{f^{*}}(\sigma)=\int_{G} f^{*}(x) \overline{\sigma(x)} \mathrm{d} x=\int_{G} \overline{f\left(x^{-1}\right) \sigma(x)} \mathrm{d} x=\int_{G} \overline{f(x)} \sigma(x) \mathrm{d} x=\overline{\hat{f}(\sigma)}
$$

So $\widehat{f^{*}}=\overline{\hat{f}}$ (pointwise conjugate). So by Stone-Weierstrass theorem, we're done. $\square$ Theorem 10.8
Lemma 10.9. The map $G \times \widehat{G} \rightarrow \mathbb{T}$ given by $(x, \sigma) \mapsto \sigma(x)$ is continuous.
Proof. Fix $\sigma \in \widehat{G}$ and $x \in G$. Let $f \in L^{1}(G)$ have $\hat{f}(\sigma) \neq 0$. Then

$$
\widehat{f}(\sigma) \sigma(x)=\int_{G} f(x) \overline{\sigma\left(y x^{-1}\right)} \mathrm{d} y=\int_{G} f(x y) \overline{\sigma(y)} \mathrm{d} y=\widehat{f \cdot x}(\sigma)
$$

Now if also $\tau \in \widehat{G}$ and $y \in G$ then

$$
\begin{aligned}
&|\widehat{f}(\sigma) \sigma(x)-\widehat{f}(\tau) \tau(y)|=|\widehat{f \cdot x}(\sigma)-\widehat{f \cdot y}(\tau)| \\
& \leqslant|\widehat{f \cdot x}(\sigma)-\widehat{f \cdot x}(\tau)|+|\widehat{f \cdot x}(\tau)-\widehat{f \cdot y}(\tau)| \\
& \leqslant|\widehat{f \cdot y}(\sigma)-\widehat{f \cdot y}(\tau)|+\|f \cdot x-f \cdot y\|_{1} \\
& \xrightarrow{y \rightarrow x, \tau \rightarrow \sigma} 0
\end{aligned}
$$

Since $\hat{f}$ is continuous, this shows that $\tau(y) \xrightarrow{y \rightarrow x, \tau \rightarrow \sigma} \sigma(x)$. Lemma 10.9

Definition 10.10. A function $u: G \rightarrow \mathbb{C}$ is called positive-definite if for each $x_{1}, \ldots, x_{n} \in G$ and $n \in \mathbb{N}$ the matrix $\left[u\left(x_{j}^{-1} x_{i}\right)\right]$ is positive semidefinite; i.e. if for $\lambda_{1}, \ldots, \lambda_{n} \in \mathbb{C}$ we have

$$
\sum_{i=1}^{n} \sum_{j=1}^{n} \lambda_{i} \overline{\lambda_{j}} u\left(x_{j}^{-1} x_{i}\right)=\left\langle\left(\begin{array}{c}
\lambda_{1} \\
\vdots \\
\lambda_{n}
\end{array}\right) \left\lvert\,\left[u\left(x_{j}^{-1} x_{i}\right)\right]\left(\begin{array}{c}
\lambda_{1} \\
\vdots \\
\lambda_{n}
\end{array}\right)\right.\right\rangle \geqslant 0
$$

Proposition 10.11. A positive-definite function $u: G \rightarrow \mathbb{C}$ satisfies

1. $u\left(x^{-1}\right)=\overline{u(x)}$ for $x \in G$
2. $|u(x)| \leqslant u(e)$ for $x \in G$.

Proof. Let $u=2, x_{1}=e$, and $x_{2}=x$. Then

$$
\left(\begin{array}{cc}
u(e) & u\left(x^{-1}\right) \\
u(x) & u(e)
\end{array}\right)
$$

is positive semidefinite. Then the claims are just exercises in linear algebra.
Notation 10.12. We let $B^{+}(G)$ denote the space of continuous positive definite functions on $G$.
So $B^{+}(G) \subseteq C_{b}(G)$.
Example 10.13.

1. Note that $\hat{G} \subseteq B^{+}(G)$. Indeed, if $x_{1}, \ldots, x_{n} \in G$ and $\lambda_{1}, \ldots, \lambda_{n} \in \mathbb{C}$ then

$$
\sum_{i=1}^{n} \sum_{j=1}^{n} \lambda_{i} \overline{\lambda_{j}} \underbrace{\sigma\left(x_{j}^{-1} x_{i}\right)}_{\overline{\sigma\left(x_{j}\right)} \sigma\left(x_{i}\right)}=\left|\sum_{j=1}^{n} \lambda_{j} \sigma\left(x_{j}\right)\right|^{2} \geqslant 0
$$

2. (Reverse Fourier-Stieltjes transform) If $\mu \in M(\widehat{G})$, we let $\check{\mu}: G \rightarrow \mathbb{C}$ be

$$
\breve{\mu}(x)=\int_{\widehat{G}} \sigma(x) \mathrm{d} \mu(\sigma)
$$

If $\mu \in M_{+}(G)$ then $\check{\mu}$ is positive definite. Indeed, suppose $x_{1}, \ldots, x_{n} \in G$ and $\lambda_{1}, \ldots, \lambda_{n} \in \mathbb{C}$. Then

Proposition 10.14. If $\mu \in M(\widehat{G})$ then $\breve{\mu}$ is uniformly continuous.
Proof. First, suppose $K=\operatorname{supp}(\mu)$ is compact in $\widehat{G}$. Suppose $\varepsilon>0$, and for each $\sigma \in K$ let

- $U_{\sigma}$ be a neighbourhood of $e$ in $G$ such that $x \in U_{\sigma}$ implies $|\sigma(x)-1|<\varepsilon$
- $W_{\sigma}$ be a neighbourhood of $\sigma$ in $\widehat{G}, V_{\sigma} \subseteq U_{\sigma}$ be such that

$$
\tau \in W_{\sigma}, x \in V_{\sigma} \Longrightarrow|\tau(x)-1|<\varepsilon
$$

(by joint continuity of $G \times \widehat{G} \rightarrow \mathbb{T}$ ). We have that

$$
K \subseteq \bigcup_{i=1}^{n} W_{\sigma_{i}}
$$

for some $\sigma_{1}, \ldots, \sigma_{n} \in K$, and we let

$$
V=\bigcap_{i=1}^{n} V_{\sigma_{i}} \subseteq G
$$

Hence if $x \in V$ and $\tau \in K$ then $|\tau(x)-1|<\varepsilon$. Now, if $x, y \in G$ with $x y^{-1} \in V$ then

$$
|\check{\mu}(x)-\check{\mu}(y)| \leqslant \int_{\widehat{G}}|\sigma(x)-\sigma(y)| \mathrm{d}|\mu|(\sigma)=\int_{\widehat{G}} \underbrace{\left|\sigma\left(x y^{-1}\right)-1\right|}_{<\varepsilon} \mathrm{d}|\mu|(G) \leqslant \varepsilon|\mu|(G)
$$

Now if $\mu \in M(\widehat{G})$, we can find compact $K \subseteq \widehat{G}$ so $\left\|\mu-\mu_{K}\right\|_{1}<\varepsilon$. The usual approximation of $\check{\mu}$ by $\widetilde{\mu_{K}}$ applies

Corollary 10.15. If $\mu \in M_{+}(\widehat{G})$, then $\breve{\mu} \in B^{+}(G)$.
A problem: we don't yet know that $f \neq 0$ in $L^{1}(G)$ implies $\widehat{f} \neq 0$ in $C_{0}(\widehat{G})$.
Proposition 10.16 (Injectivity of the reverse Fourier-Stieltjes transform). If $\mu \neq \nu$ in $M(\widehat{G})$ then $\breve{\mu} \neq \check{\nu}$ in $C_{b}(G)$.

Proof. If $f \in L^{1}(G)$, we have for $\mu \in M(G)$ that

$$
\begin{equation*}
\int_{\widehat{G}} \widehat{f} \mathrm{~d} \mu=\int_{\widehat{G}} \int_{G} f(x) \overline{\sigma(x)} \mathrm{d} x \mathrm{~d} \mu(\sigma)=\int_{G} f(x) \int_{\widehat{G}} \sigma\left(x^{-1}\right) \mathrm{d} \mu(\sigma) \mathrm{d} x=\int_{G} f(x) \breve{\mu}\left(x^{-1}\right) \mathrm{d} x \tag{3}
\end{equation*}
$$

Let $\nu(E)=\mu\left(E^{-1}\right)$ for $E \in \mathcal{B}(G)$. One can check that $\check{\nu}(x)=\breve{\mu}\left(x^{-1}\right)$. Hence if $\breve{\mu}=0$, then since $A(\widehat{G})$ is dense in $C_{0}(\widehat{G})$, we see that for $h \in C_{0}(\widehat{G})$ we have

$$
\int_{\widehat{G}} h \mathrm{~d} \mu=0
$$

and thus $\mu=0$. It is evident that $\mu \mapsto \check{\mu}$ is linear.
Proposition 10.16
Theorem 10.17 (Bochner's theorem). $B^{+}(G)=\left\{\check{\mu}: \mu \in M_{+}(G)\right\}$. Hence the map $M_{+}(G) \rightarrow B^{+}(G)$ given by $\mu \mapsto \breve{\mu}$ is a bijection.

Proof. Suppose $u \in B^{+}(G) \backslash\{0\}$. We normalize so $u(e)=\|u\|_{\infty}=1$. Define a sesquilinear form on $L^{1}(G) \times L^{1}(G)$ by

$$
[f \mid g]=\int_{G} f^{*} * g u \mathrm{~d} m
$$

Notice that

$$
|[f \mid g]| \leqslant\left\|f^{*} * g\right\|_{1}\|u\|_{\infty} \leqslant\|f\|_{1}\|g\|_{1}
$$

so $[\cdot \mid \cdot]$ is continuous on $L^{1}(G) \times L^{1}(G)$. Now

$$
\begin{aligned}
{[f \mid g] } & =\int_{G} \int_{G} \overline{f\left(x^{-1}\right)} g\left(x^{-1} y\right) u(y) \mathrm{d} x \mathrm{~d} y \\
& =\int_{G} \int_{G} \overline{f\left(x^{-1}\right)} g(y) u(x y) \mathrm{d} x \mathrm{~d} y \\
& =\int_{G} \int_{G} \overline{f(x)} g(y) u\left(x^{-1} y\right) \mathrm{d} x \mathrm{~d} y
\end{aligned}
$$

(since $G$ is unimodular). Suppose

$$
\varphi=\sum_{i=1}^{n} a_{i} 1_{E_{i}} \in S^{1}(G)
$$

(i.e. simple, integrable, $E_{i} \in \mathcal{B}(G), m\left(E_{i}\right)<\infty$, and $E_{i} \cap E_{j}=\varnothing$ for $i \neq j$ ). (Assume also that $\operatorname{supp}(\varphi)$ is compact.)

Suppose $\varepsilon>0$. We can assume by taking Borel decompositions of each $E_{i}$ that there are $x_{i} \in E_{i}$ for each $i$ such that

$$
\left|u\left(x^{-1} y\right)-u\left(x_{j}^{-1} x_{i}\right)\right| m\left(E_{j}\right) m\left(E_{i}\right)<\frac{\varepsilon}{\sum_{i, j=1}^{n}\left|a_{i}\right|\left|a_{j}\right|+1}
$$

by continuity of $u$. Then

$$
S=\sum_{i=1}^{n} \sum_{j=1}^{n} \overline{a_{j}} a_{i} u\left(x_{j}^{-1} x_{i}\right) m\left(E_{j}\right) m\left(E_{j}\right) \geqslant 0
$$

and

$$
\begin{aligned}
|[\varphi \mid \varphi]-S| & =\left|\sum_{i=1}^{n} \sum_{j=1}^{n} \overline{a_{j}} a_{i} \int_{E_{i}} \int_{E_{j}}\left(u\left(x^{-1} y\right)-u\left(x_{j}^{-1} x_{i}\right)\right) \mathrm{d} x \mathrm{~d} y\right| \\
& \leqslant \sum_{i=1}^{n} \sum_{j=1}^{n}\left|a_{j}\right|\left|a_{i}\right| \sup _{(x, y) \in E_{j} \times E_{i}}\left|u\left(x^{-1} y\right)-u\left(x_{j}^{-1} x_{i}\right)\right| m\left(E_{j}\right) m\left(E_{i}\right) \\
& <\varepsilon
\end{aligned}
$$

Hence $[\varphi \mid \varphi]>-\varepsilon$. The decomposition above can be done for any $\varepsilon>0$; hence $[\varphi \mid \varphi] \geqslant 0$. Approximating $f$ in $L^{1}(G)$ by elements $\varphi$ as above, and using continuity of $[\cdot \mid \cdot]$ we get that $[f \mid f] \geqslant 0$.

We may apply Cauchy-Schwarz inequality to see that

$$
|[f \mid g]|^{2} \leqslant[f \mid f][g \mid g]
$$

We let $\mathcal{V}$ denote a base at $e$ in relatively compact symmetric neighbourhoods. If $V \in \mathcal{V}$, we let $k_{V}=$ $(m(V))^{-1} 1_{V}$. Notice that $k_{V}^{*}=k_{V}$ by unimodularity. Also $\left(k_{V} *_{V}\right)_{V \in \mathcal{V}}$ is a summability kernel; i.e. $\left\|k_{V} * k_{V}\right\|_{1} \leqslant, \operatorname{supp}\left(k_{V} * k_{V}\right) \subseteq V^{2}$, and

$$
\int_{G} k_{V} * k_{V} \mathrm{~d} m=\chi_{1}\left(k_{V} * k_{V}\right)=1
$$

In particular, we have

$$
\lim _{V}\left[k_{V} \mid k_{V}\right]=\lim _{V} \int_{G} k_{V} * k_{V} u \mathrm{~d} m=u(e)=1
$$

and

$$
\left[k_{V} \mid f\right]=\int_{G} k_{V} * f u \mathrm{~d} m \xrightarrow{V \backslash\{e\}} \int_{G} f u \mathrm{~d} m
$$

Hence

$$
\left|\int_{G} f u \mathrm{~d} m\right|^{2}=\lim _{V}\left|\left[k_{v} \mid f\right]\right|^{2} \leqslant \underset{V}{\lim \sup }\left[k_{V} \mid k_{V}\right][f \mid f]=[f \mid f]
$$

Let $h=f^{*} * f$, so $h^{*}=h$. (One should check this.) Let $h^{* 2}=h * h, h^{* 4}=h^{* 2} * h^{* 2}$, etc. Then

$$
\begin{aligned}
\left|\int_{G} f u \mathrm{~d} m\right|^{2} \leqslant[f \mid f] & =\int_{G} h u \mathrm{~d} m \\
& \leqslant[h \mid h]^{\frac{1}{2}} \\
& =\left(\int_{G} h^{* 2} u \mathrm{~d} m\right)^{\frac{1}{2}} \\
& \leqslant\left[h^{* 2} \mid h^{* 2}\right]^{\frac{1}{4}} \\
& \leqslant\left[h^{* 4} \mid h^{* 4}\right]^{\frac{1}{8}} \\
& \leqslant \cdots \\
& \leqslant\left[h^{* 2^{n}} \mid h^{* 2^{n}}\right]^{2^{-(n+1)}} \\
& =\left(\int_{G} h^{* 2^{n+1}} u \mathrm{~d} m\right)^{2^{-(n+1)}} \\
& \leqslant\left\|h^{* 2^{n+1}}\right\|_{1}^{\frac{1}{2^{n+1}}} \\
& \xrightarrow{n \rightarrow \infty}\|\hat{h}\|_{\infty}
\end{aligned}
$$

Thus

$$
\left|\int f u \mathrm{~d} m\right|^{2} \leqslant\|\hat{h}\|_{\infty}=\left\|\widehat{f^{*}} \hat{f}\right\|_{\infty}=\left\||\hat{f}|^{2}\right\|_{\infty}=\|\hat{f}\|_{\infty}
$$

Since $A(\widehat{G})$ is dense in $C_{0}(\widehat{G})$ we have that

$$
\hat{f} \mapsto \int_{G} f u \mathrm{~d} m
$$

extends to a continuous linear functional on $C_{0}(\hat{G})$. So, by the Riesz representation theorem, there is $\mu \in M(\widehat{G})$ with

$$
\int_{G} f u \mathrm{~d} m=\int_{\widehat{G}} \widehat{f} \mathrm{~d} \mu
$$

By Equation (3), we have

$$
\int_{\hat{G}} \widehat{f} \mathrm{~d} \mu=\int_{G} f(x) \check{\mu}\left(x^{-1}\right) \mathrm{d} x=\int_{G} f(x) \check{\nu}(x) \mathrm{d} x
$$

for some $\nu$. Hence $u=\check{\nu}$. If $\varphi \in C_{0}(\widehat{G})$ then we may write

$$
\varphi=\lim _{n \rightarrow \infty} \widehat{f_{n}}
$$

by density of $A(\widehat{G})$. Then

$$
\int_{\widehat{G}}|\varphi|^{2} \mathrm{~d} \mu=\lim _{n \rightarrow \infty} \int_{\widehat{G}} \widehat{\widehat{f_{n}}} \widehat{f_{n}} \mathrm{~d} \mu=\lim _{n \rightarrow \infty} \int_{G} f_{n}^{*} * f_{n} u \mathrm{~d} m \geqslant 0
$$

so $\mu \in M_{+}(G)$.
Theorem 10.17
Proposition 10.18 (Another class of positive definite functions). Suppose $f \in L^{1} \cap L^{2}(G)$. Then $f^{*} * f \in$ $B^{+} \cap L^{1}(G)$.

Proof. That $f^{*} * f \in L^{1}(G)$ follows from the closure of $L^{1}(G)$ under convolution. We compute, for almost every $x \in G$,

$$
\begin{aligned}
\left(f^{*} * f\right)(x) & =\int_{G} \overline{f\left(y^{-1}\right)} f\left(y^{-1} x\right) \mathrm{d} x \\
& =\int_{G} \widetilde{f}(y) \tilde{f}\left(x^{-1} y\right) \mathrm{d} y \\
& =\langle\tilde{f} \mid x * \tilde{f}\rangle \\
& =\left\langle x^{-1} * \tilde{f} \mid \tilde{f}\right\rangle\left(\text { inner product on } L^{2}(G)\right)
\end{aligned}
$$

where $\tilde{f}(y)=f\left(y^{-1}\right)$ for almost every $y$; note that $\tilde{f} \in L^{1} \cap L^{2}(G)$ by unimodularity. Since $C_{c}(G)$ is dense in $L^{2}(G)$, we get that $L^{2}(G)$ has continuity of translation (same proof as for $L^{1}(G)$ ). Hence $x \mapsto\langle\tilde{f}, x * \widetilde{f}\rangle$ is continuous, so $f^{*} * f$ may be taken to be continuous. Now let $x_{1}, \ldots, x_{n} \in G$ and $\lambda_{1}, \ldots, \lambda_{n} \in \mathbb{C}$. Then

$$
\begin{aligned}
& \sum_{j=1}^{n} \sum_{i=1}^{n} \overline{\lambda_{j}} \lambda_{i} f^{*} * f\left(x_{j}^{-1} x_{i}\right) \\
= & \sum_{j=1}^{n} \sum_{i=1}^{n} \overline{\lambda_{j}} \lambda_{i}\left\langle x_{j} * \tilde{f} \mid x_{i} * \tilde{f}\right\rangle \\
= & \left\|\sum_{i=1}^{n} \lambda_{i} x_{i} * \tilde{f}\right\|_{2}^{2} \\
\geqslant & 0
\end{aligned}
$$

as desired.
$\square$ Proposition 10.18
Corollary 10.19. If $f \in C_{c}(G)$ then $f^{*} * f \in B^{+} \cap L^{1}(G)$.
We let $B(G)=\{\check{\mu}: \mu \in M(\widehat{G})\}$. Since the map $M(\widehat{G}) \rightarrow V(G) \subseteq C_{u b}(G)$ (where the latter is the collection of uniformly continuous bounded functions on $G$ ) given by $\mu \mapsto \check{\mu}$ is linear (easily seen). The Hahn-Jordan decomposition of measures then shows that $B(G)=\operatorname{span} B^{+}(G)$.
Exercise 10.20 (Probably on A3). Show that the map $G \rightarrow B^{1}(G)$ given by $x \mapsto x * f$ is continuous in $G$ and isometric in the norm on $B^{1}(G)$ given by $\|f\|_{B^{1}(G)}=\|f\|_{1}+\|\mu\|_{1}$ where $f=\breve{\mu}$ by Bochner's theorem.
Theorem 10.21 (Inversion theorem). Let $B^{1}(G)=B \cap L^{1}(G)$.

1. If $f \in B^{1}(G)$ then $\hat{f} \in L^{1}(\hat{G})$.
2. For a suitable normalization of the Haar measures $m_{G}$ and $m_{\widehat{G}}$ we have for $f \in V^{1}(G)$ that

$$
f(x)=\int_{\widehat{G}} \widehat{f}(\sigma) \sigma(x) \mathrm{d} \sigma
$$

i.e. $f=\check{\widehat{f}}$.

Proof. We proceed in stages.
(I) If $h \in L^{1}(G)$ and $f=\breve{\mu} \in B^{1}(G)$, then

$$
(h * \breve{\mu})(e)=\int_{G} h(x) \breve{\mu}\left(x^{1-} e\right) \mathrm{d} x=\int_{G} \int_{\widehat{H}} h(x) \overline{\sigma(x)} \mathrm{d} \mu(\sigma) \mathrm{d} x=\int_{\widehat{G}} \widehat{h} \mathrm{~d} \mu
$$

If also $g=\check{\nu} \in B(G)$ then

$$
\int_{\widehat{G}} \widehat{h} \widehat{\check{\nu}} \mathrm{~d} \mu=\int_{\widehat{G}} \widehat{h * \check{\nu}} \mathrm{~d} \mu=(h * \check{\nu} * \breve{\mu})(e)=(h * \breve{\mu} * \check{\nu})=\int_{\widehat{G}} \widehat{h} \widehat{\breve{\mu}} \mathrm{~d} \nu
$$

Since $A(\hat{G})=\left\{\hat{f}: f \in L^{1}(G)\right\}$ is dense in $C_{0}(G)$, we have

$$
\begin{equation*}
\widehat{\tilde{\nu}} \mathrm{d} \mu=\widehat{\tilde{\mu}} \mathrm{d} \nu \tag{4}
\end{equation*}
$$

i.e.

$$
" \frac{\mathrm{~d} \mu}{\mathrm{~d} \nu}=\frac{\widehat{\tilde{\mu}}}{\widehat{\tilde{\nu}}} "
$$

almost everywhere on $\widehat{G}$.
(II) We will define a functional $J$ on $C_{c}(\widehat{G})$, which will give (1). Fix $\psi \in C_{c}(\widehat{G})$. For each $\sigma \in \operatorname{supp}(\psi)$ there is $u \in C_{c}(G)$ with $\widehat{u}(\sigma) \neq 0$ (since $C_{c}(G)$ is dense in $L^{1}(G)$ ). Then

$$
\widehat{u^{*} * u}(\sigma)=\overline{\widehat{u}(\sigma)} \widehat{u}(\sigma)>0
$$

and hence, by compactness, we may find $u_{1}, \ldots, u_{n} \in C_{c}(G)$ such that

$$
g=\sum_{i=1}^{n} u_{i}^{*} * u_{i}
$$

- $\operatorname{supp}(\psi) \subseteq \operatorname{supp}^{\circ}(\widehat{g})=\{\sigma \in \widehat{G}: \widehat{g}(\sigma) \neq 0\}$
- $g \in B^{+} \cap L^{1}(G) \subseteq B^{1}(G)$ (by the previous corollary), and hence $g=\breve{\nu_{0}}$ for some $\nu_{0} \in M_{+}(\widehat{G})$ (by Bochner's theorem).

We let

$$
J(\psi)=\int_{\widehat{G}} \frac{\psi}{\widehat{\nu_{0}}} \mathrm{~d} \nu_{0}
$$

If $f=\breve{\mu} \in B^{1}(G)$ then we use Equation (4):

$$
\begin{aligned}
& J(\psi)=\int_{\widehat{G}} \frac{\psi}{\widehat{\widehat{\nu_{0}}} \stackrel{\tilde{\mu}}{\tilde{\mu}}} \hat{\tilde{\mu}} \mathrm{~d} \nu_{0} \\
& =\int_{\widehat{G}} \frac{\psi}{\widehat{\widehat{\nu_{0}}} \widehat{\hat{\mu}}} \widehat{\hat{\nu}_{0}} \mathrm{~d} \mu \\
& =\int_{\widehat{G}} \frac{\psi}{\widehat{\jmath}} \mathrm{~d} \mu
\end{aligned}
$$

where

$$
\psi \frac{\widehat{f}}{\widehat{f}}=\psi 1_{\operatorname{supp}^{\circ}(\hat{f})}
$$

Again, Equation (4) tells us that this is independent of the choice of $\mu \in M(\widehat{G})$ with $\breve{\mu} \in B^{1}(G)$. Notice that since $\widehat{g}=\widehat{\nu_{0}} \geqslant 0$, we see that $J(\psi)>0$ if $\psi \in C_{c}^{+}(G)$. Also

$$
\begin{equation*}
J(\psi \widehat{\widehat{\mu}})=\int_{\widehat{G}} \psi \mathrm{~d} \mu \tag{5}
\end{equation*}
$$

for appropriate $\mu$. Now let $\psi \in C_{c}(G)$ and $\tau \in \widehat{G}$; then for suitable $\nu \in M(\widehat{G})$ we have

$$
J(\psi \cdot \tau)=\int_{\hat{G}} \frac{\psi(\tau \sigma)}{\widehat{\breve{\nu}}(\sigma)} \mathrm{d} \nu(\sigma)=\int_{\hat{G}} \frac{\psi(\sigma)}{\hat{\widehat{\nu}}(\bar{\tau} \sigma)} \mathrm{d} \nu(\bar{\tau} \sigma)
$$

(Recall the change-of-variables formula

$$
\int_{X} f \circ T \mathrm{~d} \nu=\int_{X} f \mathrm{~d}\left(\nu \circ T^{-1}\right)
$$

for integration with respect to pushforward measures.)
Exercise 10.22 (Probably A3). Show that

$$
\begin{aligned}
& \breve{\mu}(x)=\tau(x) \check{\mu}(x) \\
& \widehat{\breve{\mu}}(\sigma)=\widehat{\breve{\nu}}(\bar{\tau} \sigma)
\end{aligned}
$$

In particular, the first equation shows that $\breve{\mu} \in B^{1}(G)$.
We hence see, using Equation (4), that

$$
J(\psi \cdot \tau)=\int_{\widehat{G}} \frac{\psi(\sigma)}{\widehat{\mu}(\sigma)} \mathrm{d} \mu(\sigma)=J(\psi)
$$

So $J$ is the Haar integral. Furthermore, Equation (5) yields for suitable $\mu$ and $\psi \in C_{c}(G)$ that

$$
\begin{equation*}
\int_{\widehat{G}} \psi \mathrm{~d} \mu=J(\psi \widehat{\widetilde{\mu}}) \tag{6}
\end{equation*}
$$

i.e. $\mathrm{d} \mu(\sigma)=\widehat{\tilde{\mu}}(\sigma) \mathrm{d} \sigma$. Hence $\mu \in M_{a}(\widehat{G})$; i.e. $\mathrm{d} \mu=\widehat{\tilde{\mu}} \mathrm{d} m_{\widehat{G}}$ with $\widehat{\tilde{\mu}} \in L^{1}(G)$ (by Radon-Nikodym). This proves (1).
To see (2), note that Equation (6) yields for $x \in G$ and suitable $\mu$ that

$$
\breve{\mu}(x)=\int_{\widehat{G}} \sigma(x) \mathrm{d} \mu(\sigma)=\int_{\widehat{G}} \sigma(x) \hat{\tilde{\mu}}(\sigma) \mathrm{d} \sigma
$$

Writing $f=\breve{\mu}$, we are done.
Theorem 10.21
We consider what constitutes "suitable" normalizations of $m_{G}$ and $m_{\widehat{G}}$, as in the statement of the previous theorem.

1. Suppose $G$ is compact and $m_{G}(G)=1$. Then for $\sigma \in \widehat{G}$ we have, as in the proof of discreteness of $\widehat{G}$, that

$$
\widehat{1}(\sigma)= \begin{cases}1 & \text { if } \sigma=1 \\ 0 & \text { else }\end{cases}
$$

Since $1 \in B^{+} \cap L^{1}(G) \subseteq B^{1}(G)$. Hence by the inversion theorem we have

$$
1=1(e)=\int_{\hat{G}} \hat{1}(\sigma) \underbrace{\sigma(e)}_{=1} \mathrm{~d} \sigma=m_{\hat{G}}(\{1\})
$$

So $m_{\widehat{G}}$ is the counting measure.
2. Suppose $G$ is discrete. Let $m_{G}(\{e\})=1$; i.e. that $m_{G}$ is the counting measure. Let $f=1_{\{e\}}=$ $1_{\{e\}}^{*} * 1_{\{e\}} \in B^{+} \cap L^{1}(G) \subseteq B^{1}(G)$. Then

$$
\widehat{f}(\sigma)=\sum_{x \in G} \overline{\sigma(x)} 1_{\{e\}}(x)=1
$$

and the inversion theorem yields that

$$
m_{\widehat{G}}(\widehat{G})=\int_{\widehat{G}} 1 \mathrm{~d} m_{\widehat{G}}=\int_{G} \widehat{f}(\sigma) \mathrm{d} \sigma=f(e)=1
$$

3. Let $G=\mathbb{R}$. Let $m_{\mathbb{R}}$ satisfy $m_{\mathbb{R}}([0,1])=1$. We shall choose $\alpha, \beta>0$ such that $\alpha m_{\mathbb{R}}$ and $\beta m_{\mathbb{R}}$ (also normalized as above) satisfy the inversion theorem. Since $\exp (-|x|) \geqslant 0$ for $x \in \mathbb{R}$, we get on $\mathbb{R} \cong \widehat{\mathbb{R}}$ that

$$
s \mapsto \alpha \int_{\mathbb{R}} \exp (-i s x) \exp (-|x|) \mathrm{d} x=2 \alpha \int_{0}^{\infty}=\frac{2 \alpha}{1+s^{2}}
$$

is positive-definite. Hence by the inversion theorem we have that

$$
\exp (-|x|)=2 \alpha \int_{\mathbb{R}} \frac{\exp (i s x)}{1+s^{2}} \beta \mathrm{~d} s
$$

for $x \in \mathbb{R}$. In particular, letting $x=0$, we get that

$$
1=2 \alpha \beta \int_{\mathbb{R}} \frac{1}{1+s^{2}} \mathrm{~d} s=2 \alpha \beta \pi
$$

i.e. $\alpha \beta=\frac{1}{2 \pi}$. Typical choices are $\alpha=1$ and $\beta=\frac{1}{2 \pi}$ or $\alpha=\beta=\frac{1}{\sqrt{2 \pi}}$.

Remark 10.23.

1. If $\mu, \nu \in M(\widehat{G})$, then $\widehat{\mu * \nu}=\widehat{\mu} \widehat{\nu}$ (pointwise product), so $B(G)=\{\breve{\mu}: \mu \in M(\widehat{G})\}$ is a subalgebra of $C_{b}(G)$.
2. Let $B^{2}(G)=B \cap L^{2}(G)$. If $f \in B^{1}(G)$, then

$$
\int_{G}|f|^{2} \mathrm{~d} m \leqslant\|f\|_{1}\|f\|_{\infty}<\infty
$$

so $B^{1}(G) \subseteq B^{2}(G)$.
Theorem 10.24 (Plancherel theorem). If $f \in L^{1} \cap L^{2}(G)$, then $\|\hat{f}\|_{L^{2}(\hat{G})}=\|f\|_{L^{2}(G)}$ (provided the measures are normalized as in the inversion theorem). Furthermore, there is a unitary $U: L^{2}(G) \rightarrow L^{2}(\widehat{G})$ such that $U f=\widehat{f}$ for $f \in L^{1} \cap L^{2}(G)$.
Proof. We have by a previous proposition
TODO 8. ref
that $f^{*} * f \in B^{+} \cap L^{1}(G) \subseteq B^{1}(G)$, so the inversion theorem applies. Thus, using unimodularity of $G$ and the inversion theorem, we have

$$
\begin{aligned}
\int_{G}|\widehat{f}|^{2} \mathrm{~d} m_{G} & =\int_{G} f^{*}\left(x^{-1} f(x) \mathrm{d} x\right. \\
& =\int_{G} f^{*}(x) f\left(x^{-1} e\right) \mathrm{d} x \\
& =\left(f^{*} * f\right)(e) \\
& =\int_{\widehat{G}} \widehat{f^{*} * f}(\sigma) \underbrace{\sigma(e)}_{=1} \mathrm{~d} \sigma \\
& =\int_{\widehat{G}} \overline{\hat{f}(\sigma)} \widehat{f}(\sigma) \mathrm{d} \sigma \\
& =\int_{\widehat{G}} \mid \hat{f}^{2} \mathrm{~d} m_{\widehat{G}}
\end{aligned}
$$

so we get the first statement.
We have that $L^{1} \cap L^{2}(G)$ is dense in $L^{2}(G)$. Let $\mathcal{K}=\left\{\widehat{f}: f \in L^{1} \cap L^{2}(G)\right\} \subseteq L^{2}(\widehat{G})$. It remains to show that $\mathcal{K}$ is dense in $L^{2}(\widehat{G})$.

Note that $\mathcal{K}$ is invariant under translation: we have $\sigma * \widehat{f}=\widehat{\sigma \cdot f}$ for $\sigma \in \widehat{G}$ and $f \in L^{1} \cap L^{2}(G)$. Furthermore, $\mathcal{K}$ is invariant under multiplication by $\{\hat{x}: x \in G\}$ : we have $\widehat{x} \hat{f}=\widehat{x * f}$ for $x \in G$ and $f \in L^{1} \cap L^{2}(G)$. We shall use this to show that $\mathcal{K}^{\perp}=\{0\}$, which in a Hilbert space suffices to show density.

Suppose then that $\psi \in \mathcal{K}^{\perp}$. Then for $\varphi \in \mathcal{K}$ we have

$$
0=\langle\psi \mid \widehat{x} \varphi\rangle=\int_{\widehat{G}} \overline{\psi(\sigma)} \varphi(\sigma) \sigma(x) \mathrm{d} \sigma
$$

So $\bar{\psi} \varphi=0$ by the uniqueness proposition for inverse transform.
TODO 9. ref
Fix $f \in C_{c}^{+}(G)$ with

$$
\int_{G} f \mathrm{~d} m=1
$$

Then $\varphi_{0}=\widehat{f} \in \mathcal{K}$ has

$$
\varphi_{0}(1)=\int_{G} f \mathrm{~d} m_{G}=1
$$

so there is a neighbourhood $U$ of 1 with $\varphi_{0}(\tau)>0$ for $\tau \in U$. In particular, for $\psi$ as above we have

$$
0=\bar{\psi}\left(\bar{\sigma} * \varphi_{0}\right)=\sigma *\left(\bar{\psi}\left(\bar{\sigma} * \varphi_{0}\right)=\sigma * \bar{\psi} \varphi_{0}\right.
$$

(One should check this.) Hene $\sigma * \bar{\psi}(\tau)=0$ for almost every $\tau \in U$; i.e. $\bar{\psi}(\bar{\sigma} \tau)=0$ for such $\tau$. Thus $m_{\hat{G}}$-almost-everywhere we have $\bar{\psi}=0$.Theorem 10.24
Remark 10.25. If $f \in L^{1} \cap L^{2}(\widehat{G})$ (with $\mathcal{K}$ as above), then $U^{*} f=\check{f}$,

$$
\check{f}(x)=\int_{G} f(\sigma) \sigma(x) \mathrm{d} \sigma
$$

TODO 10. Conjunction?
We do this using the first computation in the proof of the Plancherel theorem.

## Lemma 10.26.

1. If $\varphi, \psi \in C_{c}(\widehat{G})$, then $\varphi * \psi=\widehat{h}$ for some $h \in B^{1}(G)$.
2. Let $A^{p}(\widehat{G})=\left\{\widehat{f}: f \in B^{p}(G)\right\}$ for $p \in\{1,2\}$. Then $A^{p}(\widehat{G})$ is dense in $L^{p}(\widehat{G})$.

Proof.

1. $C_{c}(\widehat{G}) \subseteq L^{2}(\widehat{G})$, so $\check{\varphi}=U^{*} \varphi, \check{\psi}=U^{*} \psi \in L^{2}(G)$, and $\overline{\varphi * \psi}=\breve{\varphi} \breve{\psi} \in L^{1}(G)$. But $\check{\omega} \in B(G)$ for any $\omega \in L^{1}(\widehat{G})$; so $\varphi * \psi \in B^{1}(G)$. Let $h=\varphi * \psi$, and apply the inversion theorem.
2. Suppose $f \in L^{p}(\widehat{G})$ and $\varepsilon>0$. Let $\left(k_{i}\right)_{i}$ be a contractive summability kernel for $L^{1}(\widehat{G})$. Then for some $i$ we have $\left\|f-k_{i} * f\right\|_{p}<\varepsilon$ (A2Q1). Let $\varphi, \psi \in C_{c}(\widehat{G})$ satisfy

$$
\begin{array}{r}
\left\|k_{i}-\varphi\right\|_{1}<\varepsilon \\
\|\psi-f\|_{p}<\varepsilon
\end{array}
$$

Then

$$
\begin{aligned}
\|f-\varphi * \psi\|_{p} & \leqslant\left\|f-k_{i} * f\right\|_{p}+\left\|k_{i} * f-k_{i} * \psi\right\|_{p}+\left\|k_{i} * \psi-\varphi * \psi\right\|_{p} \\
& <\varepsilon+\varepsilon+\varepsilon \underbrace{\|\psi\|_{p}}_{\leqslant \varepsilon+\|f\|_{p}}
\end{aligned}
$$

Thus by the first item, we have $\varphi * \psi \in A^{1}(\widehat{G}) \subseteq A^{2}(\widehat{G})$, so we are done. Lemma 10.26
Our goal now is Pontryagin duality. If $x \in G$, we let $\hat{x} \in \hat{\hat{G}}$ be $\hat{x}(\sigma)=\sigma(x)$. We wish to show that the map $G \rightarrow \widehat{\hat{G}}$ given by $x \mapsto \hat{x}$ is a surjective homeomorphism.

Remark 10.27. It is evident that $x \mapsto \hat{x}$ is a homomorphism.
Given a symmetric relatively compact neighbourhood $V \subseteq G$ of $e$, we let $h_{V}=\frac{1}{m(V)} 1_{V} * 1_{V}$. Then

1. Since $1_{V}^{*}=1_{V}$ (using unimodularity), we have that $h_{V} \in B^{+} \cap L^{1}(G) \subseteq B^{1}(G)$.
2. $\operatorname{supp}\left(h_{V}\right) \subseteq V^{2}$.
3. The value at $e$ is given by

$$
h_{V}(e)=\frac{1}{m(V)} \int_{V} 1_{V}(x) 1_{V}\left(x^{-1} e\right) \mathrm{d} x=1
$$

Warning 10.28. $\left(h_{V}\right)_{V \in \mathcal{V}}$ (where $\mathcal{V}$ is the class of symmetric neighbourhoods of $e$ ) is not a summability kernel.
Proposition 10.29. The map $G \rightarrow \widehat{\hat{G}}$ given by $x \mapsto \hat{x}$ is injective.
Proof. For $h_{V}$ as above, the inversion theorem yields that

$$
h_{V}(x)=\int_{\widehat{G}} \widehat{h_{V}}(\sigma) \sigma(x) \mathrm{d} \sigma=\int_{G} \widehat{h_{V}} \widehat{x} \mathrm{~d} m_{\widehat{G}}
$$

If $x \neq e$, find $V$ so $x \notin V^{2}$; then

$$
\int_{G} \widehat{h} \widehat{x} \mathrm{~d} m_{\widehat{G}}=h_{V}(x)=0 \neq 1=h_{V}(1)=\int_{G} \widehat{h} \underbrace{\hat{e}}_{1} \mathrm{~d} m_{\widehat{G}}
$$

So $\widehat{x} \neq 1=\widehat{e}$.
Proposition 10.29
Theorem 10.30 (Pontryagin duality theorem). The map $G \rightarrow \hat{\hat{G}}$ given by $x \mapsto \hat{x}$ is a surjective homeomorphism.

Proof. Let $\Gamma=\{\widehat{x}: x \in G\} \subseteq \widehat{\hat{G}}$.
(I) We show that the map $G \rightarrow \Gamma$ given by $x \mapsto \hat{x}$ is a homeomorphism onto its image. Suppose $\left(x_{\alpha}\right)_{\alpha}$ is a net in $G$ and $x_{0} \in G$. Consider the following convergences:

1. $x_{\alpha} \xrightarrow{\alpha} x_{0}$ in $G$.
2. $f\left(x_{\alpha}\right) \xrightarrow{\alpha} f\left(x_{0}\right)$ for all $f \in B^{1}(G)$. (This is $\sigma\left(G, B^{1}(G)\right)$-convergence.)
3. $\widehat{x_{\alpha}} \xrightarrow{\alpha} \widehat{x_{0}}$ in $\widehat{\hat{G}}$.

We will show that these are equivalent.
Since $B^{1}(G) \subseteq C_{b}(G)$, we get (1) implies (2). For $h_{V}$ as above we have $x_{0} * h_{V} \in B^{1}(G)$. If (2) holds, then

$$
h_{V}\left(x_{0}^{-1} x_{\alpha}\right)=\left(x_{0} * h_{V}\right)\left(x_{\alpha}\right) \xrightarrow{\alpha}\left(x_{0} * h_{V}\right)\left(x_{0}\right)=h_{V}(e)=1
$$

Hence by construction of $h_{V}$ we see that $x_{0}^{-1} x_{\alpha}$ is eventually inside $V^{2}$. Thus (2) implies (1).
On $\widehat{\hat{G}}$ the topology $w^{*}=\sigma\left(L^{\infty}(\widehat{G}), L^{1}(\widehat{G})\right)$ coincides with $\tau=\sigma\left(L^{\infty}(\widehat{G}), A^{1}(\widehat{G})\right)$. Indeed, $\tau \subseteq w^{*}$, and since $A^{1}(\widehat{G})$ is dense in $L^{1}(\widehat{G})$, we get that $\tau \upharpoonright \operatorname{ball}\left(L^{\infty}(\widehat{G})\right)$ (closed unit ball) is Hausdorff. Two comparable compact Hausdorff topologies on $\operatorname{ball}\left(L^{\infty}(\widehat{G})\right)$ must coincide. Now we use the inversion theorem: if $f \in B^{1}(G)$ and $x \in G$ then

$$
f(x)=\int_{G} \hat{f}(\sigma) \sigma(x) \mathrm{d} \sigma=\int_{G} \hat{f} \hat{x} \mathrm{~d} m_{\hat{G}}
$$

It is then immediate that (2) and (3) are equivalent.
(II) $\Gamma$ is closed in $\hat{\hat{G}}$. By A1Q1, since $\Gamma$ is homeomorphic to $G$, we get that $\Gamma$ is complete, and thus closed.
(III) We show that $\Gamma=\hat{\hat{G}}$. If $\Gamma \varsubsetneqq \hat{\widehat{G}}$, then there is $\chi \in \hat{\hat{G}}$ and a neighbourhood $U$ of $1_{\hat{G}}$ such that $U^{2} \chi \cap \Gamma=\varnothing$. Hence if $\varphi, \psi \in C_{c}^{+}(\hat{\hat{G}})$ with $\operatorname{supp} \varphi \subseteq U$ and $\operatorname{supp} \psi \subseteq U \chi$, then $\varphi * \psi \neq 0$ but $(\varphi * \psi)(\hat{x})=0$ for each $\widehat{x} \in \Gamma$. By lemma

TODO 11. ref
there is $h \in B^{1}(\widehat{G})$ such that $\hat{h}=\varphi * \psi$; so, by inversion theorem, we have

$$
0=\widehat{h}(\widehat{x})=\int_{\widehat{G}} h(\sigma) \overline{\widehat{x}(\sigma)} \mathrm{d} \sigma=\int_{\widehat{G}} h(\sigma) \sigma\left(x^{-1}\right) \mathrm{d} \sigma=\check{h}\left(x^{-1}\right)
$$

(Recall if $h \in L^{1}(\widehat{G})$ then $\hat{h} \in A(\hat{\widehat{G}})$.) Hence $h=0$ on $\widehat{G}$ by uniqueness proposition
TODO 12. ref
This contradicts our construction, so $\Gamma=\widehat{\widehat{G}}$. Theorem 10.30

Definition 10.31. If $\mu \in M(G)$, we let the Fourier-Stieltjes transform of $\mu$ be

$$
\widehat{\mu}(\sigma)=\int_{G} \overline{\sigma(x)} \mathrm{d} \mu(x)
$$

for $\sigma \in \widehat{G}$. We let $B(\widehat{G})=\{\widehat{\mu}: \mu \in M(G)\} \subseteq C_{b}(\widehat{G})$.
Theorem 10.32 (Uniqueness theorem). The Fourier-Stieltjes transform $M(G) \rightarrow B(\widehat{G})$ is injective. Hence the Fourier transform $L^{1}(G) \rightarrow A(\widehat{G})$ given by $f \mapsto \widehat{f}$ is injective.

Proof. Let $\iota: G \rightarrow \hat{\hat{G}}$ be $\iota(x)=\hat{x}$. Given $\mu \in M(G)$, we have $\mu \circ \iota^{-1} \in M(\hat{\hat{G}})$. Then for $\sigma \in \hat{G}$ we have

$$
\widehat{\mu}(\sigma)=\int_{G} \underbrace{\overline{\sigma(x)}}_{\widehat{x}(\bar{\sigma})} \mathrm{d} \mu(x)=\int_{\widehat{G}} \widehat{x}(\bar{\sigma}) \mathrm{d}\left(\mu \circ \iota^{-1}\right)(x)=\widehat{\mu \circ \iota^{-1}}(\bar{\sigma})
$$

Hence if $\mu \neq 0$ then $\mu \circ \iota^{-1} \neq 0$; by the uniqueness proposition
TODO 13. ref
we then have that $\widehat{\mu \circ \iota^{-1}} \neq 0$, and $\widehat{\mu} \neq 0$. (It is clear that $\mu \mapsto \widehat{\mu}$ is linear.)
Theorem 10.32

## 11 Harmonic analysis on compact grapes

Let $G$ be a compact grape. We always assume $m(G)=1$.

## Fact 11.1.

1. If $\pi: G \rightarrow \mathcal{B}(\mathcal{H})^{\times}$is a representation, then there is $S \in \mathcal{B}(\mathcal{H})^{\times}$such that $S \pi(G) S^{-1} \subseteq U(\mathcal{H})$.
2. If $\pi: G \rightarrow \mathcal{B}(\mathcal{X})^{\times}$where $\mathcal{X}$ is a finite-dimensional Banach space, then there is invertible $S: \mathcal{X} \rightarrow \mathcal{H}$ such that $S \pi(G) S^{-1} \subseteq U(\mathcal{H})$. (For us $\mathcal{H}$ always means a Hilbert space.)

The moral is that for us it suffices to consider unitary representations of $G$.
Fact 11.2 (Projections on Hilbert spaces).
(i) If $\mathcal{L} \subseteq \mathcal{H}$ is a closed subspace, then there is a unique orthogonal projection $P_{\mathcal{L}} \in \mathcal{B}(\mathcal{H})$ with $P_{\mathcal{L}}^{2}=P_{\mathcal{L}}^{*}=P_{\mathcal{L}}$ and $\operatorname{Ran} P_{\mathcal{L}}=\mathcal{L}$.
(ii) If $P=P^{2}=P^{*}$ in $\mathcal{B}(\mathcal{H})$, then $P=P_{\mathcal{L}}$ with $\mathcal{L}=\operatorname{Ran}(P)$ (automatically closed).
(iii) If $\xi \in \mathcal{H}$ has $\|\xi\|=1$ then $P_{\xi}=P_{\mathbb{C} \xi}=\xi\langle\xi \mid \cdot\rangle$. (i.e. $P_{\xi}(\eta)=\xi\langle\xi \mid \eta\rangle=\langle\xi \mid \eta\rangle \xi$.)
(iii') If $\xi, \eta \in \mathcal{H}$ with $\|\xi\|=\|\eta\|$, then

$$
\left\|P_{\xi}-P_{\eta}\right\| \leqslant\|\xi\langle\xi \mid \cdot\rangle-\xi\langle\eta \mid \cdot\rangle\|+\|\xi\langle\eta \mid \cdot\rangle-\eta\langle\eta \mid \cdot\rangle\| \leqslant 2\|\xi-\eta\|
$$

Hence the map $\xi \mapsto P_{\xi}$ is continuous.
Definition 11.3. Suppose $\pi: G \rightarrow U(\mathcal{H})$ be a unitary.

- A closed subspace $\mathcal{L}$ of $\mathcal{H}$ is $\pi$-invariant if $\pi(x) \mathcal{L} \subseteq \mathcal{L}$ for each $x \in G$.
- We say $\pi$ is irreducible if the only non-zero closed $\pi$-invariant subspace is $\mathcal{H}$.

## Lemma 11.4.

1. A closed subspace $\mathcal{L} \subseteq \mathcal{H}$ is $\pi$-invariant if and only if $\pi(x) P_{\mathcal{L}}=P_{\mathcal{L}} \pi(x)$ for each $x \in G$.
2. A closed subspace $\mathcal{L} \subseteq \mathcal{H}$ is $\pi$-invariant if and only if $\mathcal{L}^{\perp}$ is $\pi$-invariant.

Proof.

1. $(\Longrightarrow)$ For $x \in G$ we have $\pi(x) P_{\mathcal{L}}=P_{\mathcal{L}} \pi(x) P_{\mathcal{L}}$. Hence

$$
P_{\mathcal{L}} \pi(x)=\left(\pi\left(x^{-1}\right) P_{\mathcal{L}}\right)^{*}=\left(P_{\mathcal{L}} \pi\left(x^{-1}\right) P_{\mathcal{L}}\right)^{*}=P_{\mathcal{L}} \pi(x) P_{\mathcal{L}}=\pi(x) P_{\mathcal{L}}
$$

$\left(\right.$ since $\left.\pi\left(x^{-1}\right)=(\pi(x))^{-1}=(\pi(x))^{*}\right)$.
$(\Longleftarrow)$ Obvious.
2. We have $P_{\mathcal{L}^{\perp}}=I-P_{\mathcal{L}}$ commutes with each $\pi(x)$ exactly when $P_{\mathcal{L}}$ does.

Proposition 11.5. If $\mathcal{H}$ is finite-dimensional then it admits an irreducible $\pi$-invariant subspace.
Proof. Let $\mathcal{L} \neq\{0\}$ be a $\pi$-invariant subspace of minimal dimension.
Proposition 11.5
Theorem 11.6. Suppose $G$ is a compact grape and $\pi: G \rightarrow U(\mathcal{H})$ a unitary representation. Then

1. $\pi$ admits a non-zero, finite-dimensional $\pi$-invariant subspace.
2. If $\pi$ is irreducible, then it is finite-dimensional.
3. Generally (without assuming irreducibility), $\pi$ is completely reducible: there is a family $\left\{\mathcal{L}_{\alpha}\right\}_{\alpha \in A}$ of closed subspaces such that
(a) Each $\mathcal{L}_{\alpha}$ is $\pi$-invariant.
(b) Each $\mathcal{L}_{\alpha}$ is irreducible for $\pi$.
(c) $\mathcal{L}_{\alpha} \perp \mathcal{L}_{\beta}$ for $\alpha \neq \beta$ in $A$.
(d) The internal direct sum

$$
\bigoplus_{\alpha \in A} \mathcal{L}_{\alpha}=\left\{\sum_{i=1}^{n} \xi_{\alpha_{i}}: n \in \mathbb{N}, \alpha_{1}, \ldots, \alpha_{n} \text { distinct in } A, \xi_{\alpha_{i}} \in \mathcal{L}_{\alpha_{i}}\right\}
$$

is dense in $\mathcal{H}$.
(Note that these conditions together with the assumption that the $\mathcal{L}_{\alpha}$ are closed will imply that the $\mathcal{L}_{\alpha}$ are finite-dimensional.) We write

$$
\pi=\bigoplus_{\alpha \in A} \pi(\cdot) \upharpoonright \mathcal{L}_{\alpha}
$$

on

$$
\mathcal{H}=\ell-\bigoplus_{\alpha \in A} \mathcal{L}_{\alpha}
$$

Note that by Pythagoras' theorem every $\xi \in \mathcal{H}$ can be written uniquely in the form

$$
\xi=\sum_{\alpha \in A} \xi_{\alpha}
$$

with each $\xi_{\alpha} \in \mathcal{L}_{\alpha}$ and

$$
\|\xi\|^{2}=\sum_{\alpha \in A}\left\|\xi_{\alpha}\right\|^{2}
$$

Proof.

1. Fix $\xi \in \mathcal{H}$ with $\|\xi\|=1$. Consider the operator

$$
K_{\xi}=\int_{G} P_{\pi(x) \xi} \mathrm{d} x
$$

(Bochner integral, since $x \mapsto P_{\pi(x) \xi}$ is continuous). Each of these is rank 1 and thus a compact operator; so $K_{\xi} \in \mathcal{K}(\mathcal{H})$ (the Banach space of compact operators on $\mathcal{H}$ ). Also if $\eta, \zeta \in \mathcal{H}$ then

$$
\begin{aligned}
\left\langle K_{\xi} \eta \mid \zeta\right\rangle & =\int_{G}\langle\pi(x) \xi\langle\pi(x) \xi \mid \eta\rangle \mid \zeta\rangle \mathrm{d} x \\
& =\int_{G}\langle\pi(x) \xi \mid \zeta\rangle\langle\eta \mid \pi(x) \xi\rangle \mathrm{d} x \\
& =\int_{G}\langle\eta \mid \pi(x) \xi\langle\pi(x) \xi \mid \zeta\rangle\rangle \mathrm{d} x \\
& =\left\langle\eta \mid K_{\xi} \zeta\right\rangle
\end{aligned}
$$

so $K_{\xi}^{*}=K_{\xi}$. If we let $\eta=\xi=\zeta$, then we get

$$
\left\langle\xi \mid K_{\xi} \xi\right\rangle=\int_{G}|\langle\xi \mid \pi(x) \xi\rangle|^{2} \mathrm{~d} x
$$

where $\langle\xi \mid \pi(e) \xi\rangle=1>0$; hence $\left\langle\xi \mid K_{\xi} \xi\right\rangle>0$, and $K_{\xi} \neq 0$. Also, if $y \in G$ and $\eta \in \mathcal{H}$ then

$$
\begin{aligned}
\pi(y) K_{\xi} \eta & =\int_{G} \pi(y x)\langle\pi(x) \xi \mid \eta\rangle \mathrm{d} x \\
& =\int_{G} \pi(x)\langle\pi(x) \xi \mid \pi(y) \eta\rangle \mathrm{d} x \\
& =K_{\xi} \pi(y) \eta
\end{aligned}
$$

Thus $\pi(y) K_{\xi}=K_{\xi} \pi(y)$. We now apply the spectral theorem to $K_{\xi}$ to get a sequence of orthogonal projections $\left\{P_{1}, P_{2}, \ldots\right\}$ (perhaps finite) and $\lambda_{1}, \lambda_{2}, \ldots \in \mathbb{R} \backslash\{0\}$ such that

$$
\lim _{n \rightarrow \infty} \lambda_{n}=0
$$

and

- $K_{\xi}=\sum_{n=1,2, \ldots} \lambda_{n} P_{n}$ (converges in norm, if the sequence is infinite).
- Each $1 \leqslant \operatorname{dim}\left(P_{n}(\mathcal{H})\right)<\infty$.
- $P_{n} P_{m}=0$ if $n \neq m$.
- For $T \in \mathcal{B}(\mathcal{H})$ we have $T K_{\xi}=K_{\xi} T$ if and only if $T P_{n}=P_{n} T$ for each $n$.

We thus have $\pi(x) P_{n}=P_{n} \pi(x)$ for each $x \in G$; so $\mathcal{L}_{n}=\operatorname{Ran} P_{n}$ is $\pi$-invariant.
2. By (1) and the last proposition, if $\pi$ is infinite dimensional, then it admits an (irreducible) $\pi$-invariant subspace.
3. We let

$$
\Lambda=\left\{\lambda=\left\{\mathcal{L}_{\alpha}\right\}_{\alpha \in A_{\lambda}}: \lambda \text { satisfies (a)-(c) above }\right\}
$$

By (1) and the last proposition we get $\Lambda \neq \varnothing$ and $\Lambda$ is partially ordered by $\subseteq$. Let $\Gamma \subseteq \Lambda$ be a chain; so $\left\{\mathcal{L}: \mathcal{L}=\mathcal{L}_{\alpha}\right.$ for some $\left.\alpha \in A_{\lambda}, \lambda \in \Gamma\right\} \in \Lambda$ is an upper bound for $\Lambda$. By Zorn's lemma, there is a maximal element $\mu=\left\{\mathcal{L}_{\alpha}\right\}_{\alpha \in A_{\mu}} \in \Lambda$. Let

$$
\mathcal{M}=\overline{\bigoplus_{\alpha \in A_{\mu}} \mathcal{L}_{\alpha}}
$$

Then $\mathcal{M}$ is $\pi$-invariant by continuity of each $\pi(x)$. If $\mathcal{M}^{\perp} \neq\{0\}$, then (1) and the last proposition yield an irreducible $\pi$-invariant subspace $\mathcal{L} \subseteq \mathcal{M}^{\perp}$. Then $\mu \cup\{\mathcal{L}\} \in \Lambda$ violates maximality of $\mu$, a contradiction. Theorem 11.6

Lemma 11.7 (Schur's lemma). Suppose $\pi: G \rightarrow U(\mathcal{H})$ is a finite-dimensional unitary representation. Then

1. $\pi$ is irreducible if and only if $(\pi(G))^{\prime}=\{T \in \mathcal{B}(\mathcal{H}): T \pi(x)=\pi(x) T$ for all $x \in G\}$ is $\mathbb{C} I$.
2. If $\pi^{\prime}: G \rightarrow U\left(\mathcal{H}^{\prime}\right)$ is another unitary representation and $\pi$ and $\pi^{\prime}$ are irreducible, then if $A \in \mathcal{B}\left(\mathcal{H}, \mathcal{H}^{\prime}\right)$ satisfies $A \pi(x)=\pi^{\prime}(x)(A)$ for each $x \in G$, then $A=c U$ for some $c \in \mathbb{C}$ and unitary $U$. (In particular, if $c \neq 0$ we $\operatorname{get} \operatorname{dim}(\mathcal{H})=\operatorname{dim}\left(\mathcal{H}^{\prime}\right)$.

We sometimes call elements of $(\pi(G))^{\prime}$ intertwiners. The finite dimensional assumption is actually superfluous, once we know the spectral theorem for von Neumann algebras.

Proof.

1. If $T \in(\pi(G))^{\prime}$ then so too is $T^{*}$. Indeed, for $x \in G$ we have

$$
T^{*} \pi(x)=\left(\pi\left(x^{-1} T\right)^{*}=\left(T \pi\left(x^{-1}\right)\right)^{*}=\pi(x) T^{*}\right.
$$

Hence each $\operatorname{Re}(T)=\frac{1}{2}\left(T+T^{*}\right), \operatorname{Im}(T)=\frac{1}{2 i}\left(T-T^{*}\right) \in(\pi(G))^{\prime}$. If $A=A^{*} \in(\pi(G))^{\prime}$, we can use spectral theorem to write

$$
A=\sum_{k=1}^{n} \lambda_{k} P_{k}
$$

Then each $P_{k}$ has $P_{k} \pi(x)=\pi(x) P_{k}$ for all $x \in G$; so $\operatorname{Ran}\left(P_{k}\right)$ is $\pi$-invariant.
$(\Longrightarrow)$ If $\pi$ is irreducible, then $A=A^{*} \in(\pi(G))^{\prime}$ implies $A=c I$ for $c \in \mathbb{R}$.
( $\Longleftarrow$ ) The only orthogonal projections in $(\pi(G))^{\prime}$ are 0 and $I$; we then use the previous lemma.
TODO 14. Ref?
2. If $A \pi(x)=\pi^{\prime}(x) A$ then

- $\operatorname{ker}(A)$ is $\pi$-invariant, and hence either $\{0\}$ or $\mathcal{H}$.
- $\operatorname{Ran}(A)$ is $\pi^{\prime}$-invariant, and hence respectively either $\mathcal{H}$ or $\{0\}$.

So $A$ is either 0 or invertible. In the latter case we hvave

$$
A^{*} A \pi(x)=A^{*} \pi^{\prime}(x) A=\pi(x) A^{*} A
$$

(where the last equality follows as in (1)). So $A^{*} A=c I$ for some $c>0$. Let $U=\frac{1}{\sqrt{c}} A$.Lemma 11.7

Corollary 11.8. If $G$ is a compact abelian grape, then each irreducible representation is multiplication by a character $\sigma \in \widehat{G}$ on $\mathbb{C}$.

Again, had we more spectral theory, we could dispense with the compactness hypothesis.

Proof. If $\pi: G \rightarrow U(\mathcal{H})$ is an irreducible representation, then for $x \in G$ we have $\pi(x) \in(\pi(G))^{\prime}=\mathbb{C} I$. Hence we can write $\pi(x)=\sigma(x) I$ for $\sigma(x) \in \mathbb{T}$ (since $\pi$ is unitary). Moreover we have

$$
\sigma(x y) I=\pi(x y)=\pi(x) \pi(y)=(\sigma(x) I)(\sigma(y) I)=\sigma(x) \sigma(y) I
$$

Clearly $x \mapsto \sigma(x)$ is continuous, as $\pi$ is. By irreducibility, we get $\operatorname{dim}\left(\mathcal{H}_{\pi}\right)=1$.
Corollary 11.8
Definition 11.9. If $\pi: G \rightarrow U(\mathcal{H})$ and $\pi^{\prime}: G \rightarrow U\left(\mathcal{H}^{\prime}\right)$ are unitary representations (not necessarily irreducible or finite dimensional), then we say $\pi$ is unitarily equivalent to $\pi^{\prime}$ if there is a unitary $U \in \mathcal{B}\left(\mathcal{H}^{\prime}, \mathcal{H}\right)$ such that $U \pi^{\prime}(x)=\pi(x) U$ for $x \in G$; i.e. $\pi^{\prime}(x)=U^{*} \pi(x) U$. We then set

$$
\operatorname{Irr}(G)=\left\{\pi: G \rightarrow U(d): \pi \text { a continuous homomorphism, }(\pi(G))^{\prime}=\mathbb{C} I_{d}\left(\text { in } M_{d}(\mathbb{C})\right)\right\}
$$

where $U(d)$ is the $d \times d$ unitary grape. We let $\widehat{G}=\operatorname{Irr}(G) / \approx$ where $\pi \approx \pi^{\prime}$ if $\pi$ and $\pi^{\prime}$ are unitarily equivalent. "Properly" speaking, we have

$$
\widehat{G}=\left\{[\pi] \mid \pi: G \rightarrow U\left(\mathcal{H}_{\pi}\right) \text { (finite dimensional irreducible unitary representation) }\right\}
$$

We have a "standard abuse of notation": we consider $\widehat{G}$ as a full set of representation of its equivalence classes; i.e. we write " $\pi \in \widehat{G}$ " rather than $[\pi] \in \widehat{G}$. We have the convention that $\pi \neq \pi^{\prime}$ in $\widehat{G}$ means that $\pi \not \approx \pi^{\prime}$.

### 11.1 Matrix coefficient functions

Given $\pi \in \widehat{G}$, we let

$$
\mathcal{T}_{\pi}=\operatorname{span}\left\{\langle\xi \mid \pi(\cdot) \eta\rangle: \xi, \eta \in \mathcal{H}_{\pi}\right\} \subseteq C(G) \subseteq L^{2}(G)
$$

since $m(G)=1$. (Note that if $U \in U\left(H_{\pi}\right)$ then $\langle U \xi \mid \pi(\cdot) U \eta\rangle=\left\langle\xi \mid U^{*} \pi(\cdot) U \eta\right\rangle$; so $\pi \mapsto \mathcal{T}_{\pi}$ is independent of equivalence class.)

Let $d_{\pi}=\operatorname{dim}\left(\mathcal{H}_{\pi}\right)$ and $\left\{e_{1}, \ldots, e_{d}\right\}$ be an orthonormal basis for $\mathcal{H}_{\pi}$. Then for $\xi, \eta \in H_{\pi}$ we have

$$
\langle\xi \mid \pi(\cdot) \eta\rangle=\left\langle\sum_{j=1}^{d_{\pi}}\left\langle e_{j} \mid \xi\right\rangle e_{j} \mid \pi(\cdot) \sum_{i=1}^{d_{\pi}}\left\langle e_{i} \mid \eta\right\rangle e_{i}\right\rangle=\sum_{j=1}^{d_{\pi}} \sum_{i=1}^{d_{\pi}}\left\langle\xi \mid e_{j}\right\rangle\left\langle e_{i} \mid \eta\right\rangle \underbrace{\left\langle e_{j} \mid \pi(\cdot) e_{i}\right\rangle}_{\pi_{i j}}
$$

Then with respect to the basis $\left\{e_{1}, \ldots, e_{d_{\pi}}\right\}$ we have that $\pi(x)=\left[\pi_{i j}(x)\right]$, and $\mathcal{T}_{\pi}=\operatorname{span}\left\{\pi_{i j}: i, j \in\right.$ $\left.\left\{1, \ldots, d_{\pi}\right\}\right\}$. This leads to:

Theorem 11.10 (Schur's orthogonality relations). Suppose $\pi, \pi^{\prime} \in \widehat{G}$. Then

1. If $\pi \neq \pi^{\prime}$ (i.e. they aren't unitarily equivalent) then $\mathcal{T}_{\pi} \perp \mathcal{T}_{\pi^{\prime}}$ in $L^{2}(G)$.
2. If $\xi, \eta, \zeta, \omega \in \mathcal{H}_{\pi}$, then

$$
\int_{G} \overline{\langle\xi \mid \pi(x) \eta\rangle}\langle\zeta \mid \pi(x) \omega\rangle \mathrm{d} x=\frac{1}{d_{\pi}}\langle\zeta \mid \xi\rangle\langle\eta \mid \omega\rangle
$$

In particular, with the notation as above, we get that $\left\{\sqrt{d_{\pi}} \pi_{i j}: i, j \in\left\{1, \ldots, d_{\pi}\right\}\right\}$ is an orthonormal basis for $\mathcal{T}_{\pi}$.

Proof. Suppose $A \in \mathcal{B}\left(\mathcal{H}_{\pi^{\prime}}, \mathcal{H}_{\pi}\right)$, and let

$$
\tilde{A}=\int_{G} \pi(x) A \pi^{\prime}\left(x^{-1}\right) \mathrm{d} x
$$

(Bochner integral in a finite-dimensional Banach space). Then for $y \in G$ we have

$$
\tilde{A} \pi^{\prime}(y)=\int_{G} \pi(x) A \pi^{\prime}(\underbrace{x^{-1} y}_{\left(y^{-1} x\right)^{-1}}) \mathrm{d} x=\int_{G} \pi(y x) A \pi^{\prime}\left(x^{-1} \mathrm{~d} x=\pi(x) \widetilde{A}\right.
$$

Hence, by Schur's lemma, we have

$$
\tilde{A}= \begin{cases}0 & \text { if } \pi \neq \pi^{\prime} \\ c I & \text { else }\end{cases}
$$

where $c \neq 0$. Now suppose $\xi, \eta \in \mathcal{H}_{\pi^{\prime}}, \zeta, \omega \in \mathcal{H}_{\pi}$, and $A=\omega\langle\eta \mid \cdot\rangle \in \mathcal{B}\left(\mathcal{H}_{\pi^{\prime}}, \mathcal{H}_{\pi}\right)$. Then

$$
\begin{aligned}
\widetilde{A} & =\int_{G} \pi(x) \omega\left\langle\pi^{\prime}(x) \eta \mid \cdot\right\rangle \mathrm{d} x \\
\langle\zeta \mid \widetilde{A} \xi\rangle & =\int_{G}\langle\zeta \mid \pi(x) \omega\rangle\left\langle\pi^{\prime}(x) \eta \mid \xi\right\rangle \mathrm{d} x \\
& =\int_{G} \overline{\left\langle\xi \mid \pi^{\prime}(x) \eta\right\rangle}\langle\zeta \mid \pi(x) \omega\rangle \mathrm{d} x
\end{aligned}
$$

Hence if $\pi \neq \pi^{\prime}$, we get the first result. If $\pi=\pi^{\prime}$, then $\widetilde{A}=c I$ for some $c \in \mathbb{C}$; we compute

$$
\begin{aligned}
c & =\frac{1}{d_{\pi}} \operatorname{Tr}(\widetilde{A}) \\
& =\frac{1}{d_{\pi}} \int_{G} \operatorname{Tr}\left(\pi(x) A \pi\left(x^{-1}\right)\right) \mathrm{d} x \\
& =\frac{1}{d_{\pi}} \int_{G} \operatorname{Tr}(A) \mathrm{d} x \\
& =\frac{1}{d_{\pi}} \operatorname{Tr}(A) \\
& =\frac{1}{d_{\pi}} \sum_{i=1}^{d_{\pi}}\left\langle e_{i} \mid A e_{i}\right\rangle \\
& =\frac{1}{d_{\pi}} \sum_{i=1}^{d_{\pi}}\left\langle e_{i} \mid \omega\right\rangle\left\langle\eta \mid e_{i}\right\rangle \\
& =\frac{1}{d_{\pi}}\langle\eta \mid \omega\rangle
\end{aligned}
$$

(where the last equality follows from Parseval).
Theorem 11.10
Definition 11.11. We set

$$
\mathcal{T}(G)=\bigoplus_{\pi \in \widehat{G}} \mathcal{T}_{\pi} \subseteq C(G) \subseteq L^{2}(G)
$$

We look to defining the tensor product of representations. If $\mathcal{H}, \mathcal{H}^{\prime}$ are finite dimensional Hilbert spaces, then on $\mathcal{H} \otimes \mathcal{H}^{\prime}$, the quantity

$$
\left\langle\sum_{i=1}^{n} \xi_{i} \otimes \xi_{i}^{\prime} \mid \sum_{j=1}^{n^{\prime}} \eta_{j} \otimes \eta_{j}^{\prime}\right\rangle=\sum_{i=1}^{n} \sum_{j=1}^{n^{\prime}}\left\langle\xi_{i} \mid \eta_{j}\right\rangle_{\mathcal{H}}\left\langle\xi_{i}^{\prime} \mid \eta_{j}^{\prime}\right\rangle_{\mathcal{H}^{\prime}}
$$

is well-defined and sesquilinear. (To check this, one fixes $\eta \otimes \eta^{\prime}$ and checks that $\left(\xi, \xi^{\prime}\right) \mapsto\left\langle\xi \otimes \xi^{\prime} \mid \eta \otimes \eta^{\prime}\right\rangle$ is bilinear on $\overline{\mathcal{H}} \times \overline{\mathcal{H}^{\prime}}$ (where $\overline{\mathcal{H}}$ has the same addition and conjugated scalar multiplication; i.e. $a \cdot \xi=\bar{a} \xi$ ). One then does the same on the right.) If $\mathcal{H}, \mathcal{H}^{\prime}$ have orthonormal bases $\left\{e_{1}, \ldots, e_{d}\right\}$ and $\left\{e_{1}^{\prime}, \ldots, e_{d^{\prime}}^{\prime}\right\}$, then $\left\{e_{i} \otimes e_{j}^{\prime}: i \in\{1, \ldots, d\}, j \in\left\{1, \ldots, d^{\prime}\right\}\right\}$ is a basis for $\mathcal{H} \otimes \mathcal{H}^{\prime}$ with $\left\langle e_{i} \otimes e_{j}^{\prime} \mid e_{k} \otimes e_{\ell}^{\prime}\right\rangle=\delta_{i j} \delta_{j \ell}$ (Kronecker $\delta$ ). So $\left\{e_{i} \otimes e_{j}^{\prime}: i \in\{1, \ldots, d\}, j \in\left\{1, \ldots, d^{\prime}\right\}\right\}$ is an orthonormal basis for $\mathcal{H} \otimes \mathcal{H}{ }^{\prime}$. If $\omega \in \mathcal{H} \otimes \mathcal{H}^{\prime}$, we write

$$
\omega=\sum_{i=1}^{d} \sum_{j=1}^{d^{\prime}} \omega_{i j} e_{i} \otimes e_{j}^{\prime}
$$

and

$$
\langle\omega \mid \omega\rangle=\sum_{i=1}^{d} \sum_{j=1}^{d^{\prime}}\left|\omega_{i j}\right|^{2} \geqslant 0
$$

is non-zero if $\omega \neq 0$. So $\langle\cdot \mid \cdot\rangle$ is an inner product on $\mathcal{H} \otimes \mathcal{H}^{\prime}$.
If $U \in U(\mathcal{H})$ and $U^{\prime} \in U\left(\mathcal{H}^{\prime}\right)$, then

$$
\left(U \otimes U^{\prime}\right) \sum_{i=1}^{n} \xi_{i} \otimes \xi_{i}^{\prime}=\sum_{i=1}^{n} U \xi_{i} \otimes U^{\prime} \xi_{i}^{\prime}
$$

is a well-defined unitary operator. Given $\pi, \pi^{\prime} \in \widehat{G}$, the map

$$
\begin{aligned}
\pi \otimes \pi^{\prime}: G & \rightarrow U\left(\mathcal{H}_{\pi} \otimes \mathcal{H}_{\pi^{\prime}}\right) \\
x & \mapsto \pi(x) \otimes \pi^{\prime}(x)
\end{aligned}
$$

defines a unitary representation of $G$ that is independent of unitary equivalence class up to unitary equivalence. Warning 11.12. There is no reason to expect that $\pi \otimes \pi^{\prime}$ be irreducible.

By complete reducibility, we have

$$
\pi \otimes \pi^{\prime}=\bigoplus_{i=1}^{n} \pi_{i}^{\left(m_{i}\right)}
$$

for $\pi_{1}, \ldots, \pi_{n} \in \widehat{G}$ and $m_{i} \in \mathbb{N}$ the "multiplicity". So $\mathcal{T}(G)$ is an algebra of functions. Indeed, given $\pi, \pi^{\prime} \in \widehat{G}$ and $\xi, \eta \in \mathcal{H}_{\pi}, \zeta, \omega \in \mathcal{H}_{\pi^{\prime}}$, we have

$$
\begin{aligned}
\langle\xi \mid \pi(\cdot) \eta\rangle\langle\zeta \mid \pi(\cdot) \omega\rangle & =\left\langle\xi \otimes \zeta \mid \pi \otimes \pi^{\prime}(\cdot) \eta \otimes \omega\right\rangle \\
& =\left\langle\xi \otimes \zeta \mid\left(\bigoplus_{i=1}^{n} \pi_{i}^{\left(m_{i}\right)}\right) \eta \otimes \omega\right\rangle \\
& =\left\langle\xi \otimes \zeta \mid \sum_{i=1}^{n} \sum_{j=1}^{m_{i}} P_{i j} \pi_{i}(\cdot) P_{i j} \eta \otimes \omega\right\rangle \\
& =\sum_{i=1}^{n} \sum_{j=1}^{m_{i}}\left\langle P_{i j}(\xi \otimes \zeta) \mid \pi_{i}(\cdot) P_{i j}(\eta \otimes \omega)\right\rangle \\
& \in \mathcal{T}(G)
\end{aligned}
$$

where $P_{i j}$ are orthogonal projections.
Definition 11.13 (Conjugate representation). Suppose $\pi \in \widehat{G}$ and $\left\{e_{1}, \ldots, e_{d_{\pi}}\right\}$ an orthonormal basis for $\mathcal{H}_{\pi}$ with $\pi_{i j}(\cdot)=\left\langle e_{j} \mid \pi(\cdot) e_{i}\right\rangle$. We define $\bar{\pi}: G \rightarrow U\left(\mathcal{H}_{\pi}\right)$ by $\bar{\pi}(x)=\left[\pi_{i j}(x)\right]$ (with respect to the chosen orthonormal basis).

Suppose $\pi=U^{*} \pi^{\prime}(\cdot) U$ for unitary $U$. Then $\left(U^{*}\right)_{i k}=\overline{U_{k i}}$. Then

$$
\pi=U^{*} \pi^{\prime}(\cdot) U=\left[\sum_{k, \ell=1}^{d_{\pi}} \overline{U_{i k}} \pi_{k \ell}^{\prime}(\cdot) U_{\ell j}\right]
$$

So

$$
\bar{\pi}=\left[\sum_{k, \ell=1}^{d_{\pi}} U_{i k} \overline{\pi_{k \ell}^{\prime}(\cdot)} \overline{U_{\ell j}}\right]=(\bar{U})^{*} \overline{\pi^{\prime}}(\cdot) \bar{U}
$$

(where $\bar{U}=\left[\overline{U_{i j}}\right]$ ). Thus $\pi \approx \pi^{\prime}$ implies $\bar{\pi} \approx \overline{\pi^{\prime}}$.
Note also that $\mathcal{T}(G)$ is conjugate-closed: we have $\overline{\langle\xi \mid \pi(\cdot) \eta\rangle}=\langle\bar{\xi} \mid \bar{\pi}(\cdot) \bar{\eta}\rangle$ where $\bar{\xi}$ and $\bar{\eta}$ are pointwise conjugated with respect to some orthonormal basis.
Remark 11.14. If $G$ is abelian then for $\sigma, \sigma^{\prime} \in \widehat{G}$ we have $\sigma \otimes \sigma^{\prime} \cong \sigma \sigma^{\prime}$ as $\mathbb{C} \otimes \mathbb{C} \cong \mathbb{C}$; hence $\bar{\sigma}=\sigma^{-1}$.
Notation 11.15. We let $\lambda: G \rightarrow U\left(L^{2}(G)\right)$ be the left regular representation, so $\lambda(x) f(y)=f\left(x^{-1} y\right)$ for almost every $y$. Note that $C(G) \subseteq L^{2}(G)$ is a dense (hence not closed) $\lambda$-invariant subspace.

Theorem 11.16 (Peter-Weyl).

1. For $\pi \in \widehat{G}$ let $\left\{e_{1}^{\pi}, \ldots, e_{d_{\pi}}^{\pi}\right\}$ be an orthonormal basis for $\mathcal{H}_{\pi}$, and let

$$
\mathcal{T}_{\pi, j}=\operatorname{span}\left\{\pi_{i j}: i \in\left\{1, \ldots, d_{\pi}\right\}\right\} \subseteq \mathcal{T}_{\pi} \subseteq C(G) \subseteq L^{2}(G)
$$

Then $\mathcal{T}_{\pi, j}$ is $\lambda$-invariant, and $\lambda_{\pi, j}=P_{\pi, j} \lambda(\cdot) \upharpoonright \mathcal{T}_{\pi, j} \approx \bar{\pi}$ (where $P_{\pi, j}$ is the orthogonal projection onto $\left.\mathcal{T}_{\pi, j}\right)$.
2. We have

$$
\mathcal{T}(G)=\bigoplus_{\pi \in \widehat{G}} \mathcal{T}_{\pi}
$$

is uniformly dense in $C(G)$, and hence $L^{2}$-dense in $L^{2}(G)$.
3. We have

$$
\lambda=\bigoplus_{\pi \in \widehat{G}} \pi^{\left(d_{\pi}\right)}
$$

on

$$
L^{2}(G)=\ell^{2}-\bigoplus_{\pi \in \widehat{G}} \bigoplus_{j=1}^{d_{\pi}} \mathcal{T}_{\bar{\pi}, j} \cong \ell^{2}-\bigoplus_{\pi \in \widehat{G}} \mathcal{H}_{\pi}^{\left(d_{\pi}\right)}
$$

and in particular $\left\{\sqrt{d_{\pi}} \pi_{i j}: i, j \in\left\{1, \ldots, d_{\pi}\right\}, \pi \in \widehat{G}\right\}$ is an orthonormal basis for $L^{2}(G)$.
Proof.

1. If $x, y \in G$ then using the matrix product we have

$$
\lambda(x) \pi_{i j}(y)=\pi_{i j}\left(x^{-1} y\right)=\sum_{k=1}^{d_{\pi}} \underbrace{\pi_{i k}\left(x^{-1}\right)}_{\widehat{\pi_{k i}}(x)} \pi_{k j}(y)
$$

i.e.

$$
\lambda(x) \pi_{i j}=\sum_{k=1}^{d_{\pi}} \overline{\pi_{k i}}(x) \pi_{k j}
$$

Let $U_{j}: \mathcal{H}_{\pi} \rightarrow \mathcal{T}_{\pi, j}$ be given by $U_{j} e_{i}^{\pi}=\sqrt{d_{\pi}} \pi_{i j}$. Then for $x \in G$ we have

$$
\begin{aligned}
U_{j}^{*} \lambda_{\pi, j}(x) U_{j} e_{i}^{\pi} & =U_{j}^{*} \lambda_{\pi, j}(x) \sqrt{d_{\pi}} \pi_{i j} \\
& =U_{j}^{*} \sqrt{d_{\pi}} \sum_{k=1}^{d_{\pi}} \overline{\pi_{k i}}(x) \pi_{k j} \\
& =\sum_{k=1}^{d_{\pi}} \overline{\pi_{k i}(x)} e_{k}^{\pi} \\
& =\bar{\pi}(x) e_{i}^{\pi}
\end{aligned}
$$

so $U_{j}^{*} \lambda_{\pi, j}(\cdot) U_{j}=\bar{\pi}$.
2. Let us see that $\mathcal{T}(G)$ is point separating. Notice that if $x \neq e$ in $G$ and $V$ is a symmetric relatively compact neighbourhood of $e$ with $x \in V^{2}$ then $\lambda(x) 1_{V}=1_{x V}$ and $1_{x V} \neq 1_{V}=\lambda(e) 1_{V}$ so $\lambda(x) \neq \lambda(e)$. Hence if $x \neq y$ in $G$ then $\lambda(x) \neq \lambda(y)\left(\right.$ as $\left.\lambda\left(x^{-1} y\right)=\lambda(e)\right)$. By complete reducibility there is a finite-dimensional $\lambda$-invariant $\lambda$-irreducible subspace $\mathcal{L} \subseteq L^{2}(G)$ such that $\lambda(x) \upharpoonright \mathcal{L} \neq \lambda(y) \upharpoonright \mathcal{L}$. Then there are $\xi, \eta \in \mathcal{L}$ such that $\pi=\lambda(\cdot) \upharpoonright \mathcal{L}$ satisfies $\langle\xi \mid \pi(x) \eta\rangle \neq\langle\xi \mid \pi(y) \eta\rangle$. Hence, by Stone-Weierstrass we have $\mathcal{T}(G)$ is uniformly dense in $C(G)$.
3. We simply use (1), and use (2) to see that $\left\{\sqrt{d_{\pi}} \pi_{i j}(\cdot): i, j \in\left\{1, \ldots, d_{\pi}\right\}, \pi \in \widehat{G}\right\}$ is a maximal orthonormal set in $L^{2}(G)$.

### 11.2 Fourier analysis on compact grapes

Definition 11.17 (Fourier transform). If $f \in L^{1}(G)$ and $\pi \in \widehat{G}$ we let

$$
\widehat{f}(\pi)=\int_{G} f(x) \pi\left(x^{-1} \mathrm{~d} x \in \mathcal{B}\left(H_{\pi}\right)\right.
$$

(Bochner integral). This is also

$$
[\int_{G} f(x) \underbrace{\pi_{i j}\left(x^{-1}\right)}_{\overline{\pi_{j i}(x)}} \mathrm{d} x]
$$

where we've chosen an orthonormal basis for $H_{\pi}$.
If $f \in L^{2}(G) \subseteq L^{1}(G)$ (by the last result of Hölder/Cauchy-Schwarz inequality), then by the results on orthonormal bases in Hilbert spaces we get $L^{2}$-convergence

$$
\begin{aligned}
f & =\sum_{\pi \in \hat{G}} \sum_{i, j=1}^{d_{\pi}}\left\langle\sqrt{d_{\pi}} \pi_{i j} \mid f\right\rangle \sqrt{d_{\pi}} \pi_{i j} \\
& =\sum_{\pi \in \hat{G}} d_{\pi} \sum_{i, j=1}^{d_{\pi}} \underbrace{\left(\int_{G} f(x) \overline{\pi_{i j}}(x) \mathrm{d} x\right)}_{\int_{G} f(x) \pi_{j i}\left(x^{-1}\right)} \mathrm{d} x \pi_{i j} \\
& =\vdots \\
& =\sum_{\pi \in \hat{G}} d_{\pi} \operatorname{Tr}((\hat{f}(\pi)) \pi(\cdot))
\end{aligned}
$$

where there may be an arithmetic error in the last formula. This leads to:
Theorem 11.18 (Inversion theorem). If $f \in \mathcal{T}(G)$ then for $x \in G$ we have

$$
f(x)=\sum_{\pi \in \hat{G}} d_{\pi} \operatorname{Tr}(\hat{f}(\pi) \pi(x))
$$

Proof. The right hand side (call it $\tilde{f}$ ) is in $\mathcal{T}(G)$, and $\|f-\tilde{f}\|_{2}=0$, so $f=\tilde{f}$ on $G$ as each is continuous. Theorem 11.18

Theorem 11.19 (Plancherel/Riesz-Fischer). If $f \in L^{1}(G)$ then

$$
f \in L^{2}(G) \Longleftrightarrow \sum_{\pi \in \hat{G}} d_{\pi}\|\hat{f}(\pi)\|_{\mathrm{HS}\left(H_{\pi}\right)}^{2}
$$

where

$$
\|A\|_{\mathrm{HS}\left(H_{\pi}\right)}^{2}=\sum_{i, j=1}^{d_{\pi}}\left|\left\langle e_{j}^{\pi} \mid A e_{i}^{\pi}\right\rangle\right|^{2}
$$

is the Hilbert-Schmidt norm. Furthermore we have

$$
\|f\|_{2}=\left(\sum_{\pi \in \hat{G}} d_{\pi}\|\widehat{f}(\pi)\|_{\mathrm{HS}\left(H_{\pi}\right)}^{2}\right)^{\frac{1}{2}}
$$

i.e.

$$
L^{2}(G)=\ell^{2}-\bigoplus_{\pi \in \hat{G}} \sqrt{d_{\pi}} \operatorname{HS}\left(H_{\pi}\right)
$$

Proof. Riesz-Fischer theorem.
Theorem 11.20 (Parseval's formula). If $f, g \in L^{2}(G)$ then

$$
\int_{G} \bar{f} g \mathrm{~d} m=\sum_{\pi \in \widehat{G}} d_{\pi} \operatorname{Tr}\left((\widehat{f}(\pi))^{*} \widehat{g}(\pi)\right)
$$

Proposition 11.21 (Uniqueness). If $\mu \in M(G)$ then the Fourier-Stieltjes transform is given on $\pi$ in $\hat{G}$ by

$$
\widehat{\mu}(\pi)=\int_{G} \pi\left(x^{-1}\right) \mathrm{d} \mu(x)
$$

Then if $\widehat{\mu}(\pi)=0$ for every $\pi \in \widehat{G}$ we must have $\mu=0$.
Proof. If $\widehat{\mu}(\pi)=0$ for all $\pi$ then

$$
\int_{G} f \mathrm{~d} \mu=0
$$

for all $f \in \mathcal{T}(G)$. So

$$
\int_{G} f \mathrm{~d} \mu=0
$$

for all $f \in C(G)$, since $\overline{\mathcal{T}(G)}{ }^{\|\cdot\|_{\infty}}=C(G)$ by Peter-Weyl. Hence $\mu=0$ (by Riesz representation theorem).Proposition 11.21

### 11.3 Character theory

If $\rho: G \rightarrow U(\mathcal{H})$ is a finite-dimensional unitary representation, we define its character to be $\chi_{\rho}=\operatorname{Tr} \circ \rho: G \rightarrow \mathbb{C}$.
Proposition 11.22. Suppose $\pi, \pi^{\prime} \in \widehat{G}$ and $\rho: G \rightarrow U(\mathcal{H})$ is a finite dimensional representation. Then

1. $\chi_{\pi} \chi_{\pi^{\prime}}=\chi_{\pi \otimes \pi^{\prime}}=\sum_{i=1}^{n} m_{i} \chi_{\pi_{i}}$, where

$$
\pi \otimes \pi^{\prime}=\bigoplus_{i=1}^{n} \pi_{i}^{\left(m_{i}\right)}
$$

with $\pi_{i} \in \widehat{G}$.
2. $\int_{G} \overline{\chi_{\pi}} \chi_{\rho} \mathrm{d} m=m(\pi, \rho):=\max \left\{m \in\{0\} \cup \mathbb{N}: \pi^{(m)}\right.$ is equivalent to a subring of $\left.\rho\right\}$.
3. $\rho \in \widehat{G} \Longleftrightarrow \int_{G}\left|\chi_{\rho}\right|^{2} \mathrm{~d} m=1$
4. If we let 1 be the trivial representation then

$$
m\left(1, \pi \otimes \pi^{\prime}\right)= \begin{cases}1 & \text { if } \pi^{\prime}=\pi \\ 0 & \text { else }\end{cases}
$$

Proof.

1. Suppose $x \in G$. Then

$$
\begin{aligned}
\chi_{\pi}(x) \chi_{\pi^{\prime}}(x) & =\operatorname{Tr}(\pi(x)) \operatorname{Tr}\left(\pi^{\prime}(x)\right) \\
& =\operatorname{Tr}\left(\pi(x) \otimes \pi^{\prime}(x)\right) \text { (check, linear algebra) } \\
& =\operatorname{Tr}\left(\bigoplus_{i=1}^{n} \pi_{i}^{\left(m_{i}\right)}(x)\right) \\
& =\sum_{i=1}^{n} m_{i} \operatorname{Tr}\left(\pi_{i}(x)\right) \\
& =\sum_{i=1}^{n} m_{i} \chi_{\pi_{i}}
\end{aligned}
$$

2. Suppose

$$
\rho=\bigoplus_{i=1}^{n} \pi_{i}^{\prime\left(m_{i}\right)}
$$

then

$$
\pi \otimes \rho=\bigoplus_{i=1}^{n}\left(\pi \otimes \pi_{i}^{\prime}\right)^{\left(m_{i}\right)}
$$

We then use the first item and the Schur orthogonality relations.
3. If

$$
\rho=\bigoplus_{i=1}^{n} \pi_{i}^{\left(m_{i}\right)}
$$

then as above we have

$$
\chi_{\rho}=\sum_{i=1}^{n} m_{i} \chi_{\pi_{i}}
$$

So

$$
\overline{\chi_{\rho}} \chi_{\rho}=\sum_{i, j=1}^{n} m_{i} m_{j} \overline{\chi_{j}} \chi_{\pi_{i}}
$$

So

$$
\int_{G}\left|\chi_{\rho}\right|^{2} \mathrm{~d} m=\sum_{i, j=1}^{n} m_{i} m_{j} \underbrace{\int_{G} \chi_{\overline{\pi_{j}}} \chi_{\pi_{i}} \mathrm{~d} m}_{\delta_{i j}} \mathrm{~d} m=\sum_{k=1}^{n} m_{k}^{2}
$$

This is $>1$ unless $\rho$ is irreducible.
4. Combine the second and third items.Proposition 11.22
Definition 11.23 (Normalized characters). If $\pi \in \widehat{G}$ we let $\psi_{\pi}=\frac{1}{d_{\pi}} \chi_{\pi}$.
Then if

$$
\pi \otimes \pi^{\prime}=\bigoplus_{i=1}^{n} \pi_{i}^{\left(m_{i}\right)}
$$

for distinct $\pi_{1}, \ldots, \pi_{n} \in \widehat{G}$, then

$$
\psi_{\pi} \psi_{\pi^{\prime}}=\sum_{i=1}^{n} \frac{m_{i}}{d_{\pi} d_{\pi^{\prime}}} \chi_{\pi_{i}}=\underbrace{\sum_{i=1}^{n} \frac{m_{i} d_{\pi_{i}}}{d_{\pi} d_{\pi^{\prime}}} \psi \psi_{\pi_{i}}}_{\text {convex combination }}
$$

This motivates the following:
Definition 11.24. A discrete hypergrape is a set $\Gamma$ such that $\ell^{1}(\Gamma)$ admits a product which satisfies

1. $\delta_{\gamma} \cdot \delta_{\gamma^{\prime}} \in \operatorname{Prob}(\Gamma)=\left\{\left(p_{\gamma}\right)_{\gamma \in \Gamma}: \sum_{\gamma \in \Gamma} p_{\gamma}=1, p_{\gamma} \geqslant 0\right\}$.
2. There is an identity for $\cdot$, call it $\delta_{1}$
3. There is an involution $\gamma \mapsto \bar{\gamma}$ (i.e. with $\gamma=\overline{\bar{\gamma}})$ such that $\delta_{1} \in \operatorname{supp}\left(\delta_{\gamma} \cdot \delta_{\gamma^{\prime}}\right)$ if and only if $\gamma^{\prime}=\bar{\gamma}$.

## 12 Amenability

Definition 12.1 (von Neumann). A discrete grape $G$ is called amenable (Day) provided there is a finitely additive probability measure $\mu: \mathcal{P}(G) \rightarrow[0,1]$ satisfying

- $\mu(\varnothing)=0$
- $\mu(A \cup B)=\mu(A)+\mu(B)$ when $A \cap B=\varnothing$.
- $\mu(G)=1$.
- $\mu(x E)=\mu(E)$ for $x \in G$ and $E \in \mathcal{P}(G)$.

Proposition 12.2. There is a bijective correspondence between finitely additive probability measures on a set $X$ and

$$
\mathcal{M} \ell^{\infty}(X)=\left\{M \in \ell^{\infty}(X)^{*}: M(\varphi) \geqslant 0 \text { if } \varphi \geqslant 0 \text { in } \ell^{\infty}(X), M(1)=1\right\}
$$

(These are called means.)
Proof. Given $M \in \mathcal{M} \ell^{\infty}(X)$, let $\mu(E)=M\left(1_{E}\right)$. Conversely, given a finitely additive probability measure $\mu$ consider $S(X)=\operatorname{span}\left\{1_{E}: E \in \mathcal{P}(X)\right\}$. Then check that

- $S(X)$ is dense in $\ell^{\infty}(X)$.
- Each $\psi \in S(X)$ can be uniquely represented in the form

$$
\psi=\sum_{i=1}^{n} a_{i} 1_{E_{i}}
$$

with the $a_{i}$ distinct elements of $\mathbb{C}$ and $E_{i} \cap E_{j}=\varnothing$ for $i \neq j$.
Define $M_{0}: S(X) \rightarrow \mathbb{C}$ by

$$
M_{0}(\psi)=\sum_{i=1}^{n} a_{i} \mu\left(E_{i}\right)
$$

Then this is a bounded linear functional on $S(X)$, and hence extends uniquely to $\ell^{\infty}(X)$.
Example 12.3 (Ultrafilter limits). Let $\mathcal{U}$ be an ultrafilter on $X$; i.e. $\mathcal{U} \subseteq \mathcal{P}(X) \backslash\{\varnothing\}$ with $A, B \in \mathcal{U} \Longrightarrow$ $A \cap B \in \mathcal{U}$, and if $E \in \mathcal{P}(X)$ then exactly one of $E$ and $X \backslash E$ lies in $\mathcal{U}$.

Define $\delta_{\mathcal{U}}: \mathcal{P}(X) \rightarrow[0,1]$ by

$$
\delta_{\mathcal{U}}(E)= \begin{cases}1 & \text { if } E \in \mathcal{U} \\ 0 & \text { else }\end{cases}
$$

The associated mean on $\ell^{\infty}(X)$ will be denoted $L_{\mathcal{U}}$ (ultrafilter limit).
Definition 12.4. We say a discrete grape is amenable if there is $M \in \mathcal{M} \ell^{\infty}(G)$ such that $M(\varphi \cdot x)=M(\varphi)$ for $\varphi \in \ell^{\infty}(G)$ and $x \in G$.

Question 12.5. Now let $G$ be a (not necessarily discrete) locally compact grape. What space replaces $\ell^{\infty}(G)$ ? $L^{\infty}(G) ? C_{b}(G) ? C_{\mathrm{lu}}(G)=\left\{\varphi \in C_{b}(G): x \mapsto \varphi \cdot x: G \rightarrow C_{b}(G)\right.$ is continuous \}? (One should check that $C_{\mathrm{lu}}(G)$ is closed in $C_{b}(G)$.)

Definition 12.6. Let $\mathcal{E}$ be any of $L^{\infty}(G), C_{b}(G), C_{\mathrm{lu}}(G)$. We let $\mathcal{M E}=\left\{M \in \mathcal{E}^{*}: M(\varphi) \geqslant 0\right.$ if $\varphi \geqslant$ $0, M(1)=1\}$ denote the means on $\mathcal{E}$. We call $M \in \mathcal{M} \mathcal{E}$ left-invariant if $M(\varphi \cdot x)=M(\varphi)$ for $\varphi \in \mathcal{E}$ and $x \in G$.

We will tend to prefer $L^{\infty}(G)$ and $C_{\mathrm{lu}}(G)$.

Remark 12.7. Since the map $C_{\mathrm{lu}}(G) \times G \rightarrow C_{\mathrm{lu}}(G)$ given by $(\varphi, x) \mapsto \varphi \cdot x$ is continuous, we may define an action of $L^{1}(G)$ on $C_{\mathrm{lu}}(G)$

$$
\varphi \cdot f=\int_{G}(\varphi \cdot x) f(x) \mathrm{d} x
$$

(Bochner integral) for $\varphi \in L^{1}(G)$ and $f \in C_{\mathrm{lu}}(G)$.
Notation 12.8. Let

$$
P^{1}(G)=\left\{f \in L^{1}(G): f \geqslant 0 \text { almost everywhere, } \int_{G} f \mathrm{~d} m=1\right\}
$$

Proposition 12.9. Suppose $M \in \mathcal{M} C_{\mathrm{lu}}(G)$. Then $M$ is left-invariant if and only if $M(\varphi \cdot f)=M(\varphi)$ for all $\varphi \in C_{\mathrm{lu}}(G)$ and $f \in P^{1}(G)$.

Proof.
$(\Longrightarrow)$ Note that

$$
M(\varphi \cdot f)=\int_{G} \underbrace{M(\varphi \cdot x)}_{=M(\varphi)} f(x) \mathrm{d} x=M(\varphi)
$$

$(\Longleftarrow)$ If $x \in G$ and $f \in P^{1}(G)$, then $x * f \in P^{1}(G)$. Then for $\varphi \in C_{\mathrm{lu}}(G), x \in G$, and $f \in P^{1}(G)$ we have

$$
M(\varphi \cdot x)=M((\varphi \cdot x) \cdot f)=M(\varphi \cdot(x * f))=M(\varphi)
$$

(One should check the second equality.)
Proposition 12.9
Notation 12.10. We run into a problem: for $\varphi \in L^{\infty}(G)$ the map $x \mapsto \varphi \cdot x$ may not be norm continuous. For $f \in L^{1}(G)$ and $\varphi \in L^{\infty}(G)$, we define $\varphi \cdot f$ by

$$
\langle\varphi \cdot f, g\rangle=\int_{G} \varphi \cdot f=\int_{G} \varphi f * g \mathrm{~d} m
$$

i.e. if $L_{f}: L^{1}(G) \rightarrow L^{1}(G)$ is convolution on the left by $f$, then we set $\varphi \cdot f=L_{f}^{*} \varphi$ (adjoint operator).

Remark 12.11. Notice that if $f, f^{\prime} \in L^{1}(G)$ and $\varphi \in L^{\infty}(G)$, then

$$
\varphi \cdot\left(f * f^{\prime}\right)=L_{f * f^{\prime}}^{*}(\varphi)=\left(L_{f} L_{f^{\prime}}\right)^{*} \varphi=L_{f^{\prime}}^{*} L_{f}^{*} \varphi=(\varphi \cdot f) \cdot f^{\prime}
$$

Likewise we have $(\varphi \cdot f) \cdot x=\varphi \cdot(f * x)$ for $x \in G$. (One should check this.) Finally, note that

$$
\|\varphi \cdot f\|_{\infty}=\left\|L_{f}^{*} \varphi\right\|_{\infty} \leqslant\left\|L_{f}\right\|\|\varphi\|_{\infty} \leqslant\|f\|_{1}\|\varphi\|_{\infty}
$$

Proposition 12.12. If $\varphi \in L^{\infty}(G)$ and $f \in L^{1}(G)$, then $\varphi \cdot f \in C_{\mathrm{lu}}(G)$.
Proof. First note that for $x, y \in G$ we have

$$
\|(\varphi \cdot f) \cdot x)-(\varphi \cdot f) \cdot y\left\|_{\infty} \leqslant\right\| \varphi\left\|_{\infty}\right\| f * x-f * y \|_{1} \xrightarrow{x \rightarrow y} 0
$$

One checks that this implies that $\varphi \cdot f$ is equal almost everywhere to an element of $C_{\mathrm{lu}}(G)$.
Theorem 12.13. The following are equivalent:

1. $L^{\infty}(G)$ admits a left-invariant mean.
2. $C_{c}(G)$ admits a left-invariant mean.
3. $C_{\mathrm{lu}}(G)$ admits a left-invariant mean.

Proof.
$\xrightarrow{(1) \Longrightarrow(2)}$ Restriction.
$\xrightarrow{(2)} \Longrightarrow(3)$ Restriction.
$\mathbf{( 3 ) \Longrightarrow ( 1 )}$ Let $\left(k_{\alpha}\right)_{\alpha \in A} \subseteq P^{1}(G)$ be a summability kernel. If $\varphi \in L^{\infty}(G)$ then $\varphi \cdot k_{\alpha} \in C_{\mathrm{lu}}(G)$ for each $\alpha$ by previous lemma. Let $\mathcal{U}$ be an ultrafilter on $A$ containing all cofinal subsets. If $a, b \in \ell^{\infty}(A)$ with $\lim _{\alpha \in A}\left(a_{\alpha}-b_{\alpha}\right)=0$, then $L_{\mathcal{U}}(a)=L_{\mathcal{U}}(b)$. (Recall that $L_{\mathcal{U}}$ denotes the ultrafilter limit mean.) Given left-invariant $M \in \mathcal{M} C_{\text {lu }}(G)$, we let

$$
\begin{aligned}
M_{\mathcal{U}}: L^{\infty}(G) & \rightarrow \mathbb{C} \\
\varphi & \mapsto L_{\mathcal{U}}\left(\left(M\left(\varphi \cdot k_{\alpha}\right)\right)_{\alpha \in A}\right)
\end{aligned}
$$

It is now straightforward to check that

- $M_{\mathcal{U}}$ is linear and bounded with $\left\|M_{\mathcal{U}}\right\| \leqslant\|M\|$.
- $M_{\mathcal{U}}(\varphi) \geqslant 0$ if $\varphi \geqslant 0$ in $L^{\infty}(G)$.
- $M_{\mathcal{U}}(1)=1$.

So $M \in \mathcal{M} L^{\infty}(G)$. Now if $f \in P^{1}(G)$ then

$$
\lim _{\alpha \in A} k_{\alpha} * f=f=\lim _{\alpha \in A} f * k_{\alpha}
$$

(by A2). Hence for $\varphi \in L^{\infty}(G)$ we have

$$
\begin{aligned}
M_{\mathcal{U}}(\varphi \cdot f) & =L_{\mathcal{U}}\left(\left(M\left(\varphi \cdot\left(f * k_{\alpha}\right)\right)\right)_{\alpha \in A}\right) \\
& =L_{\mathcal{U}}((M(\underbrace{\varphi \cdot\left(k_{\alpha} * f\right)}_{\left(\varphi \cdot k_{\alpha}\right) \cdot f}))_{\alpha \in A}) \\
& =L_{\mathcal{U}}\left(\left(M\left(\varphi \cdot k_{\alpha}\right)\right)_{\alpha \in A}\right) \\
& =M_{\mathcal{U}}(\varphi)
\end{aligned}
$$

Corollary 12.14. $G$ is amenable if and only if there is $M \in \mathcal{M} L^{\infty}(G)$ such that $M(\varphi \cdot f)=M(\varphi)$ for $\varphi \in L^{\infty}(G)$ and $f \in P^{1}(G)$.

Proof. Built into the proof of the previous theorem.
Corollary 12.14
Notation 12.15. Since $\left(L^{1}(G)\right)^{*}=L^{\infty}(G)$, we regard $L^{1}(G) \subseteq\left(L^{\infty}(G)\right)^{*}$.

## Lemma 12.16.

1. $\mathcal{M} L^{\infty}(G)$ is $w^{*}$-compact and convex.
2. ${\overline{P^{1}(G)}}^{\mathrm{w}}=\mathcal{M} L^{\infty}(G)$.

Proof.

1. It is straightforward that $\mathcal{M} L^{\infty}(G)$ is convex and $\mathrm{w}^{*}$-closed. Moreover, $\mathcal{M} L^{\infty}(G) \subseteq \operatorname{ball}\left(\left(L^{\infty}(G)\right)^{*}\right)$ (closed unit ball); hence by Banach-Alaoglu it follows that $\mathcal{M} L^{\infty}(G)$ is $\mathrm{w}^{*}$-compact. Indeed, note that since $\|\varphi\|_{\infty} 1-|\varphi| \geqslant 0$, we have $M(|\varphi|) \leqslant\|\varphi\|_{\infty}$. Next, by Cauchy-Schwarz inequality, we have

$$
|M(\bar{\varphi} \psi)| \leqslant(M(\bar{\varphi} \varphi))^{\frac{1}{2}}(M(\psi \bar{\psi}))^{\frac{1}{2}} \leqslant\left\||\varphi|^{2}\right\|_{\infty}^{\frac{1}{2}}\left\||\psi|^{2}\right\|_{\infty}^{\frac{1}{2}}=\|\varphi\|_{\infty}\|\psi\|_{\infty}
$$

(note that Cauchy-Schwarz applies since $M(\bar{\varphi} \psi)$ is a Hermitian bilinear form). So

$$
|M(\varphi)|=|M(1 \varphi)| \leqslant\|1\|_{\infty}\|\varphi\|_{\infty}=\|\varphi\|_{\infty}
$$

2. Since $P^{1}(G) \subseteq \mathcal{M} L^{\infty}(G)$, we get ${\overline{P^{1}(G)}}^{w^{*}} \subseteq \mathcal{M} L^{\infty}(G)$ by $(1)$. Let $M \in \mathcal{M} L^{\infty}(G) \subseteq \operatorname{ball}\left(\left(L^{\infty}(G)\right)^{*}\right)$ (by proof of (1)). Then by Goldstine's theorem we have a net $\left(f_{\alpha}\right)_{\alpha}$ in ball $\left(L^{1}(G)\right.$ such that

$$
M=\mathrm{w}^{*}-\lim _{\alpha} f_{\alpha}
$$

Write each

$$
f_{\alpha}=\sum_{k=0}^{3} i^{k} f_{\alpha, k}
$$

with each $f_{\alpha, k} \geqslant 0$ and $f_{\alpha, k} \leqslant\left|f_{\alpha}\right|$; so $\left\|f_{\alpha, k}\right\|_{1} \leqslant\|f\|_{1}$. If $\varphi \geqslant 0$ in $L^{\infty}(G)$ then

$$
0 \leqslant M(\varphi)=\lim _{\alpha} i^{k} \underbrace{\int_{G} f_{\alpha, k} \varphi}_{\geqslant 0} \mathrm{~d} m
$$

So since positives span $L^{\infty}(G)$ we see that

$$
\begin{aligned}
M & =\mathrm{w}^{*}-\lim _{\alpha}\left(f_{\alpha, 0}-f_{\alpha, 2}\right) \\
0 & =\mathrm{w}^{*}-\lim _{\alpha}\left(f_{\alpha, 1}-f_{\alpha, 3}\right)
\end{aligned}
$$

But also

$$
1=M(1)=\lim _{\alpha} \int_{G}\left(f_{\alpha, 0}-f_{\alpha, 2}\right) \mathrm{d} m=\lim _{\alpha}\left(\left\|f_{\alpha, 0}\right\|_{1}-\left\|f_{\alpha, 2}\right\|_{1}\right)
$$

But each of $\left\|f_{\alpha, 0}\right\|_{1},\left\|f_{\alpha, 2}\right\|_{1}$ lies in $[0,1]$. So

$$
\begin{aligned}
\lim _{\alpha}\left\|f_{\alpha, 0}\right\|_{1} & =1 \\
\lim _{\alpha}\left\|f_{\alpha, 2}\right\|_{1} & =0
\end{aligned}
$$

We conclude that

$$
M=\mathrm{w}^{*}-\lim _{\alpha} \frac{1}{\left\|f_{\alpha, 0}\right\|_{1}} f_{\alpha, 0} \in{\overline{P^{1}(G)}}^{w^{*}}
$$

as desired.
Theorem 12.17 (Reiter). The following are equivalent:

1. $G$ is amenable.
2. There is a net $\left(f_{\alpha}\right)_{\alpha}$ in $P^{1}(G)$ such that

$$
\lim _{\alpha}\left\|f * f_{\alpha}-f_{\alpha}\right\|_{1}=0
$$

for $f \in P^{1}(G)$.
3. Given $\varepsilon>0$ and $K \subseteq G$ compact there is $r \in P^{1}(G)$ such that $\|x * r-r\|_{1}<\varepsilon$ for $x \in K$.
4. There is a net $\left(r_{\alpha}\right)$ in $P^{1}(G)$ such that for $K \subseteq G$ compact we have

$$
\limsup _{\alpha} \sup _{x \in K}\left\|x * r_{\alpha}-r_{\alpha}\right\|_{1}=0
$$

(We call such a net a Reiter net.)
5. There is a net $\left(r_{\alpha}\right)$ in $P^{1}(G)$ such that

$$
\lim _{\alpha}\left\|x * r_{\alpha}-r_{\alpha}\right\|=0
$$

for $x \in G$. (We call such a net an asymptotically invariant net.)

Proof.
$(1) \Longrightarrow(2)$ Let $M \in \mathcal{M} L^{\infty}(G)$ satisfy that $M(\varphi \cdot f)=M(\varphi)$ for $\varphi \in L^{\infty}(G)$ and $f \in P^{1}(G)$ (by last corollary).
TODO 15. ref
Let $\left(g_{\alpha}\right)_{\alpha \in A}$ in $P^{1}(G)$ satisfy

$$
M=w^{*} \lim _{\alpha \in A} g_{\alpha}
$$

(by lemma). Then for $\varphi \in L^{\infty}(G)$ and $f \in P^{1}(G)$ we have

$$
0=M(\varphi-\varphi \cdot f)=\lim _{\alpha \in A} \int_{G} g_{\alpha}(\varphi-\varphi \cdot f) \mathrm{d} m=\lim _{\alpha \in A} \int_{G}\left(f * g_{\alpha}-g_{\alpha}\right) \varphi \mathrm{d} m
$$

So

$$
\mathrm{w}-\lim _{\alpha \in A}\left(f * g_{\alpha}-g_{\alpha}\right)=0
$$

(weak limit). If $F \subseteq P^{1}(G)$ is finite, we let

$$
C_{F}=\operatorname{conv}\left\{\left(f * g_{\alpha}-g_{\alpha}\right)_{f \in F}: \alpha \in A\right\} \subseteq\left(L^{1}(G)\right)^{F}
$$

(finite product of Banach spaces). By the Hahn-Banach theorem we have ${\overline{C_{F}}}^{\text {w }}={\overline{C_{F}}}^{\|\cdot\|}$ (where $\|\cdot\|$ is any "natural" norm on $\left.\left(L^{1}(G)\right)^{F}\right)$. So $0 \in{\overline{C_{F}}}^{\mathrm{w}}=\overline{C_{F}}\|\cdot\|$. Now let

$$
C_{P^{1}(G)}=\operatorname{conv}\left\{\left(f * g_{\alpha}-g_{\alpha}\right)_{f \in P^{1}(G)}: \alpha \in A\right\} \subseteq\left(L^{1}(G),\|\cdot\|_{1}\right)^{P^{1}(G)}
$$

Since $0 \in{\overline{C_{F}}}^{\|} \cdot \|$ for each $F$, we have that $0 \in{\overline{C_{P^{1}(G)}}}^{\text {prod }}$. Hence there is a net $\left(f_{\beta}\right) \operatorname{in} \operatorname{conv}\left\{g_{\alpha}: \alpha \in A\right\}$ such that

$$
0=\operatorname{prod}-\lim _{\beta}\left(f * f_{\beta}-f_{\beta}\right)
$$

for $f \in P^{1}(G)$. So

$$
0=\lim _{\beta}\left\|f * f_{\beta}-f_{\beta}\right\|_{1}
$$

for each $f \in P^{1}(G)$.
$(2) \Longrightarrow(3)$ Fix $\varepsilon>0, f \in P^{1}(G)$, and $K \subseteq G$ compact. Let $U$ be a relatively compact neighbourhood of $e$ such that $\|x * f-f\|_{1}<\varepsilon$ for $x \in U$. Then

$$
\left\|\frac{1}{m(U)} 1_{U} * f-f\right\|_{1} \leqslant \frac{1}{m(U)} \int_{U}\|x * f-f\|_{1} \mathrm{~d} x \leqslant \varepsilon
$$

Let $x_{1}, \ldots, x_{n} \in G$ be such that

$$
K \subseteq \bigcup_{k=1}^{n} x_{k} U
$$

Use the hypothesis to find $\alpha_{0}$ such that

$$
\|\underbrace{\frac{1}{m(U)} 1_{x_{k} U}}_{\in P^{1}(G)} * f * f_{\alpha_{0}}-f_{\alpha_{0}}\|_{1}<\varepsilon
$$

for $k \in\{1, \ldots, n\}$. So $\left\|f * f_{\alpha_{0}}-f_{\alpha_{0}}\right\|_{1}<\varepsilon$. We let $r=f * f_{\alpha_{0}}$. Then for $x \in U$ and $k \in\{1, \ldots, n\}$ we have

$$
\begin{aligned}
\left\|\left(x_{k} x\right) * r-r\right\|_{1} & \leqslant\left\|\left(x_{k} x\right) * r-\frac{1}{m(U)} 1_{x_{k} U} * r\right\|_{1}+\left\|\frac{1}{m(U)} 1_{x_{k} U} * r-f_{\alpha_{0}}\right\|_{1}+\left\|f_{\alpha_{0}}-r\right\|_{1} \\
& \leqslant\left\|x_{k} *\left(x * f x * f-\frac{1}{m(U)} 1_{U} * f\right) * f_{\alpha_{0}}\right\|_{1}+2 \varepsilon \\
& \leqslant\|x * f-f\|_{1}+\left\|f-\frac{1}{m(U)} 1_{U} * f\right\|_{1}+2 \varepsilon \\
& <4 \varepsilon
\end{aligned}
$$

Thus

$$
\sup _{x \in K}\|x * r-r\|_{1} \leqslant 4 \varepsilon
$$

$\underline{(3) \Longrightarrow(4)}$ Let $A=\{(K, \varepsilon): K \subseteq G$ compact, $\varepsilon>0\}$, preordered by $(K, \varepsilon) \leqslant\left(K^{\prime}, \varepsilon^{\prime}\right)$ if $K \subseteq K^{\prime}$ and $\varepsilon>\varepsilon^{\prime}$. For each $\alpha=(K, \varepsilon) \in A$ we let $r_{\alpha}$ satisfy (3).
$(4) \Longrightarrow(5)$ Clear.
$(5) \Longrightarrow(1)$ Any w*-cluster point of an asymptotically invariant net is left-invariant.
Corollary 12.18. The following are equivalent:

1. $G$ is amenable.
2. $L^{\infty}(G)$ admits a right-invariant mean.
3. $L^{\infty}(G)$ admits a two-sided invariant mean.

Note: we are not suggesting that any left-invariant mean is also right-invariant; just that such means exist.

Proof.
$\mathbf{( 1 ) \Longrightarrow ( 2 )}$ Let $M \in \mathcal{M} C_{b}(G)$ be a left-invariant mean. Consider the map $\varphi \mapsto \breve{\varphi}$ for $\varphi \in C_{b}(G)$ give by $\check{\varphi}(x)=\varphi\left(x^{-1}\right)$. This is an isomorphism of the algebra $C_{b}(G)$ with $\check{1}=1$ and $\breve{\varphi} \geqslant 0$ if $\varphi \geqslant 0$. Let $\widetilde{M}$ be given by $\widetilde{M}(\varphi)=M(\breve{\varphi})$. Then $\widetilde{M}$ is right-invariant. Hence there is a right-invariant mean on $C_{\mathrm{ru}}$, and hence on $L^{\infty}(G)$.
$\mathbf{( 1 )} \Longrightarrow \mathbf{( 3 )}$ Let $\left(f_{\alpha}\right)$ be an asymptotically left-invariant net in $P^{1}(G)$. Then $\left(f_{\alpha}^{*}\right)$ is an asymptotically right invariant net. Consider the net $\left(f_{\alpha} * f_{\alpha}^{*}\right)$ in $P^{1}(G)$. (Recall that $P^{1}(G)$ is closed under convolution.) Now if $x, y \in G$ we have

$$
\begin{aligned}
\left\|x * f_{\alpha} * f_{\alpha}^{*} * y-f_{\alpha} * f^{*}\right\|_{1} & \leqslant\left\|x * f_{\alpha} * f_{\alpha}^{*} * y-x * f_{\alpha} * f_{\alpha}^{*}\right\|_{1}+\left\|x * f_{\alpha} * f_{\alpha}^{*}-f_{\alpha} * f_{\alpha}^{*}\right\|_{1} \\
& \leqslant\left\|f_{\alpha}^{*} * y-f_{\alpha}^{*}\right\|_{1}+\left\|x * f_{\alpha}-f_{\alpha}\right\|_{1} \\
& \xrightarrow{\alpha} 0
\end{aligned}
$$

Anny w*-cluster point of this last net in $\mathcal{M} L^{\infty}(G)$ is thus a two-sided invariant mean.Corollary 12.18

## 13 Extent of amenable grapes

Remark 13.1. If $G$ is compact then $G$ is amenable.
Proposition 13.2. If $G$ is abelian then $G$ is amenable.
Proof. For $x \in G$ we let $L_{x} \in \mathcal{B}\left(L^{1}(G)\right)$ be $L_{x}(f)=x * f$. Then $L_{x}^{*}(\varphi)=\varphi \cdot x$ for $\varphi \in L^{\infty}(G)$. We recall that $\mathcal{M} L^{\infty}(G)$ is $\mathrm{w}^{*}$-compact and convex, and each $L_{x}^{*}\left(\mathcal{M} L^{\infty}(G)\right) \subseteq \mathcal{M} L^{\infty}(G)$. Since $G$ is abelian we get that $\left\{L_{x}^{*}: x \in G\right\}$ is a commuting (semi)grape of affine maps in $\mathcal{M} L^{\infty}(G)$. We then apply Markov-Kakutani; any fixed point is then a left-invariant mean. Proposition 13.2

Remark 13.3. Suppose $\beta: G \rightarrow H$ is a continuous homomorphism with dense range. Then the map $C_{\mathrm{lu}}(H) \rightarrow C_{\mathrm{lu}}(G)$ given by $\varphi \mapsto \varphi \circ \beta$ satisfies:

- It is a linear isometry (dense range)

TODO 16. conjunction?

- $1_{H} \circ \beta=1_{G}$
- $\varphi \circ \beta \geqslant 0$ if $\varphi \geqslant 0$.

Note that $(\varphi \circ \beta) \cdot x=(\varphi \cdot \beta(x)) \circ \beta$, which is why each $\varphi \circ \beta \in C_{\mathrm{lu}}(G)$.
Proposition 13.4. If $\beta: G \rightarrow H$ is a continuous homomorphism with dense range and $G$ is amenable, then $H$ is amenable.

Proof. Let $M_{G}$ be a left-invariant mean on $C_{\mathrm{lu}}(G)$. Define $M_{H}$ on $C_{\mathrm{lu}}(H)$ by $M_{H}(\varphi)=M_{G}(\varphi \circ \beta)$. Then $M_{H}$ is a left-invariant mean on $C_{\mathrm{lu}}(H)$. Proposition 13.4

Remark 13.5. Some consequences:

1. Let $G_{d}$ be $G$ with the discrete topology. If $G_{d}$ is amenable, then so is $G$. Indeed, we just consider the identity $\operatorname{map} \beta: G_{d} \rightarrow G$. (In this case we say that $G$ is discretely amenable.)
2. If $N$ is a closed normal subgrape of $G$ and $G$ is amenable then so too is $G / N$. Indeed, we just consider the quotient $\operatorname{map} \beta: G \rightarrow G / N$.

Proposition 13.6. Suppose $G$ admits an amenable closed normal subgrape $N$ for which $G / N$ is amenable. Then $G$ is amenable.

Proof. (The philosophy is to use Weil's "integral" formula.) Let $q: G \rightarrow G / N$ denote the quotient map. Then $\varphi \mapsto \varphi \circ q$ is a map

$$
C_{\mathrm{lu}}(G / N) \rightarrow C_{\mathrm{lu}}(G: N)=\left\{\varphi \in C_{\mathrm{lu}}(G): \varphi=n \cdot \varphi \text { for } n \in N\right\}
$$

that is surjective. Indeed, if $\varphi \in C_{\mathrm{lu}}(G: N)$, we let $\widetilde{\varphi}(x N)=\varphi(x)$. Since $q$ is an open map it follows that $\widetilde{\varphi} \in C_{\mathrm{lu}}(G / N)$, and $\widetilde{\varphi} \circ q=\varphi$.

Let $M_{N} \in \mathcal{M} C_{b}(N)$ be left-invariant. Let $T_{M_{N}}: C_{\mathrm{lu}}(G) \rightarrow C_{\mathrm{lu}}(G: N)$ be given by

$$
T_{M_{N}} \varphi(x)=M_{N}(\varphi \cdot x \upharpoonright N)=M_{N}(n \mapsto \varphi(x n))
$$

Then

- $\left|T_{M_{N}} \varphi(x)\right| \leqslant\|\varphi \cdot x\|_{\infty}=\|\varphi\|_{\infty}$, and $T_{M_{N}}$ is linear.
- $\left|T_{M_{N}} \varphi(x)-T_{M_{N}} \varphi(x)\right| \leqslant\|\varphi \cdot x-\varphi \cdot y\|_{\infty}$; so $T_{M_{N}} \varphi$ is continuous and $\left(T_{M_{N}} \varphi\right) \cdot z=T_{M_{N}}(\varphi \cdot z)$, so $T_{M_{N}} \varphi \in C_{\mathrm{lu}}(G)$.
- $T_{M_{N}}\left(C_{\mathrm{lu}}(G)\right) \subseteq C_{\mathrm{lu}}(G: N)$ since for $x \in G$ and $n \in N$ we have

$$
T_{M_{N}} \varphi(x n)=M_{N}(\varphi \cdot(x n) \upharpoonright N)=M_{N}\left(n^{\prime} \mapsto \varphi\left(x n n^{\prime}\right)\right)=M_{N}(\varphi \cdot x \upharpoonright N)=T_{M_{N}} \varphi(x)
$$

Let $\widetilde{T_{M_{N}}} \varphi \in C_{\mathrm{lu}}(G / N)$ be the associated element, as above. We have left-invariant $M_{G / N} \in \mathcal{M} C_{\mathrm{lu}}(G / N)$. Let $M_{G}: C_{\mathrm{lu}}(G) \rightarrow \mathbb{C}$ be given by $M_{G}(\varphi)=M_{G / N}\left(\widetilde{T_{M_{N}}} \varphi\right)$. One checks that $\widetilde{T_{M_{N}}}(\varphi \cdot x)=\widetilde{T_{M_{N}} \varphi} \varphi \cdot x N$; it then follows that $M_{G}$ is a left-invariant mean.

Proposition 13.6
Corollary 13.7. Solvable grapes are amenable.
Proof. Evident induction. (Recall here that $G^{(n)}=\overline{\left[G^{(n-1)}, G^{(n-1)}\right]}$ (closure) with $G^{(0)}=G$.)
Corollary 13.7
Example 13.8. Euclidean motion $\mathbb{R}^{n} \rtimes \mathrm{SO}(n)$.
Remark 13.9 (Tits). If $\mathbb{K}$ is a field and $G \leqslant \mathrm{GL}_{n}(\mathbb{K})$ (discrete) then either

- $G \supseteq F$ with $F \cong F_{2}$ (free grape on two generators)
- $G \supseteq G_{1}$ with $\left[G: G_{1}\right]<\infty$ and $G_{1}$ is solvable.

Proposition 13.10. If $G$ is amenable and $H$ is an open subgrape, then $H$ is amenable.

Proof. Let $T$ be a transversal for right cosets of $H$ in $G$. We define $S_{T}: C_{b}(H) \rightarrow C_{b}(G)$ by $S_{T} \varphi(h t)=$ $\varphi(h)$ with $h \in H$ and $t \in T$. Then $S_{T}$ is a linear isometry with $S_{T} 1_{H}=1_{G}$ and $S_{T} \varphi \geqslant 0$ if $\varphi \geqslant 0$. Let $M_{H} \in \mathcal{M} C_{b}(H)$ be given by $M_{H}(\varphi)=M_{G}\left(S_{T} \varphi\right)$ (where $M_{G}$ is a left-invariant mean in $\mathcal{M} C_{B}(G)$ ).

Proposition 13.10
Proposition 13.11. Suppose there is a family $\left(G_{\alpha}\right)_{\alpha \in A}$ of open subgrapes indexed over a directed set $A$ with $G_{\alpha} \subseteq G_{\alpha^{\prime}}$ if $\alpha \leqslant \alpha^{\prime}$; suppose each $G_{\alpha}$ is amenable, and that

$$
G=\bigcup_{\alpha \in A} G_{\alpha}
$$

Then $G$ is amenable.
Proof. For each $\alpha$ let $M_{\alpha}$ be a left-invariant mean in $\mathcal{M} C_{B}\left(G_{\alpha}\right)$. Let $\widetilde{M_{\alpha}} \in \mathcal{M} C_{b}(G)$ be given by $\widetilde{M_{\alpha}}(\varphi)=$ $M_{\alpha}\left(\varphi 1_{G_{\alpha}}\right)$. Then $\left(\widetilde{M_{\alpha}}\right)_{\alpha \in A}$ lies in $\mathcal{M} C_{b}(G)$, and hence has a cluster point $M$. If $x \in G$, say $x \in G_{\alpha_{0}}$, and $\varphi \in C_{b}(G)$, then for $\alpha \geqslant \alpha_{0}$, we have

$$
\widetilde{M_{\alpha}}(\varphi \cdot x)=M_{\alpha}\left(\left(\varphi 1_{G_{\alpha}}\right) \cdot x\right)=M_{\alpha}\left(\varphi 1_{G_{\alpha}}\right)=\widetilde{M_{\alpha}}(\varphi)
$$

It follows that $M$ is left-invariant.
Proposition 13.11
Remark 13.12. If we do not have an increasing family of open amenable subgrapes, then we can't conclude that $G$ is amenable. Consider for example

$$
F_{2}=\bigcup_{x \in F_{2}}\langle x\rangle
$$

Theorem 13.13 (Følner). The following are equivalent:

1. $G$ is amenable.
2. Given $\varepsilon, \delta>0$ and $K \subseteq G$ compact, there are $E \subseteq G$ compact and Borel $N \subseteq K$ such that $m(N)<\delta$ and

$$
\frac{m(x E \triangle E)}{m(E)}<\varepsilon
$$

for $x \in K \backslash N$. (Here $\triangle$ denotes the symmetric difference.)
3. Given $\varepsilon>0$ and $K \subseteq G$ compact, there is compact $F \subseteq G$ such that

$$
\frac{m(x F \triangle F)}{m(F)}<\varepsilon
$$

for $x \in K$. (This is the Følner condition.)
4. There is a net $\left(F_{\alpha}\right)$ of compact subsets of $G$ such that for any compact $K \subseteq G$ we have

$$
\lim _{\alpha} \sup _{x \in K} \frac{m\left(x F_{\alpha} \triangle F_{\alpha}\right)}{m\left(F_{\alpha}\right)}=0
$$

(We call this a Følner net.)
Before the proof, some consequences:
Example 13.14 (Discrete abelian grapes are amenable). Suppose $G$ is an abelian grape; then

$$
G=\bigcup_{F \subseteq G \text { finite }}\langle F\rangle
$$

By the previous proposition
TODO 17. ref
it suffices to consider a finitely generated grape. There is an obvious quotient map $q_{F}: \mathbb{Z}^{F} \rightarrow\langle F\rangle$. Hence it suffices to see that any $\mathbb{Z}^{k}$ (for $k \in \mathbb{N}$ ) is amenable. Consider the sequence $F_{n}=\{-n,-(n-1), \ldots, n-1, n\}^{k}$. One checks that this is a Følner sequence. In fact $\frac{1}{(2 n+1)^{k}} 1_{F_{n}}$ is a Reiter sequence.
Example 13.15. Consider $F_{2}=\langle a, b\rangle$. If $K \subseteq F_{2}$ is finite, we let

$$
\partial K=\left\{x \in K:\left\{a x, b x, a^{-1} x, b^{-1} x\right\} \nsubseteq K\right\}
$$

Then an inequality something like $|K| \leqslant 2|\partial K|$ holds (see Cayley graph), which implies that the Følner condition must fail.

Proof of Theorem 13.13.
$(1) \Longrightarrow(2)$
(I) Given $\varepsilon^{\prime}>0$, let us find

- compact $E_{1} \supseteq E_{2} \supseteq \cdots \supseteq E_{n}$ with $m\left(E_{n}\right)>0$ and
- $\lambda 1, \ldots, \lambda_{n}>0$ such that

$$
\sum_{j=1}^{n} \lambda_{j}=1
$$

such that

$$
\psi=\sum_{j=1}^{n} \frac{\lambda_{j}}{m\left(E_{j}\right)} 1_{E_{j}}
$$

satisfies

$$
\begin{equation*}
\|x * \psi-\psi\|_{1}<\varepsilon^{\prime} \text { for } x \in K \tag{7}
\end{equation*}
$$

First, Retier's, theorem gives $r \in P^{1}(G)$ such that $\|x * r-r\|_{1}<\varepsilon^{\prime}$ for $x \in K$. There is a sequence $\left(f_{n}^{\prime}\right)_{n=1}^{\infty}$ in $C_{c}(G)$ such that

$$
\lim _{n \rightarrow \infty}\left\|f_{n}^{\prime}-r\right\|_{1}=0
$$

Then let

$$
f_{n}=\frac{1}{\left\|f_{n}^{\prime}\right\|_{1}}\left|f_{n}^{\prime}\right| \in P^{1}(G)
$$

and check that

$$
\lim _{n \rightarrow \infty}\left\|f_{n}-r\right\|_{1}=0
$$

Hence there is $f \in C_{c}(G)$ such that $\|x * f-f\|_{1}<\varepsilon^{\prime}$.
Now we perform a "layer cake" construction. Fix $n \in \mathbb{N}$. For $j \in\{1, \ldots, n\}$, let

$$
E_{j}=f^{-1}\left(\left[\frac{j}{n+1}\|f\|_{\infty}, \infty\right)\right)
$$

So $\operatorname{supp}(f) \supseteq E_{1} \supseteq \cdots \supseteq E_{n}$ with $m\left(E_{n}\right)$. We then define

$$
\psi_{n}^{\prime}=\sum_{j=1}^{n} \frac{\|f\|_{\infty}}{n+1} 1_{E_{j}}
$$

This then satisfies

$$
\psi_{n}^{\prime} \leqslant f \leqslant \psi_{n}^{\prime}+\frac{1}{n+1} 1_{\operatorname{supp}(f)}
$$

It follows that

$$
0<\int_{G} \psi_{n}^{\prime} \mathrm{d} m=\underbrace{\sum_{j=1}^{n} \frac{\|f\|_{\infty} m\left(E_{j}\right)}{n+1}}_{\left\|\psi_{n}^{\prime}\right\|_{1}} \leqslant \int_{G} f \mathrm{~d} m=1 \leqslant \int_{G} \psi_{n}^{\prime} \mathrm{d} m+\frac{m(\operatorname{supp}(f))}{n+1}
$$

Let

$$
\psi_{n}=\frac{1}{\left\|\psi_{n}^{\prime}\right\|_{1}} \psi_{n}^{\prime}=\sum_{j=1}^{n} \underbrace{\frac{\|f\|_{\infty} m\left(E_{j}\right)}{(n+1)\left\|\psi_{n}^{\prime}\right\|_{1}}}_{\lambda_{j}>0} \frac{1}{m\left(E_{j}\right)} 1_{E_{j}}
$$

and observe that $\psi_{n}=\sum_{j=1}^{n} \frac{\lambda_{j}}{m\left(E_{j}\right)} 1_{E_{j}}$ and $\sum_{j=1}^{n} \lambda_{j}=1$. Furthermore, it is a routine computation that

$$
\left\|\psi_{n}-f\right\|_{1} \leqslant \frac{1}{2} n+1 m(\operatorname{supp}(f))
$$

and hence for large enough $n$, say $\frac{2}{n+1} \operatorname{supp}(f)<\frac{\varepsilon^{\prime}}{2}$, we are done.
(II) We let $\psi$ satisfy Equation (7), with $\varepsilon^{\prime}=\frac{\varepsilon \delta}{m(K)}$, provided $m(K)>0$ (otherwise we let $N=K$ and we are done). Note that if $E, F \subseteq G$ with $E \cap F=\varnothing$ and $x \in G$ then

$$
x E \triangle E) \cap(x F \triangle F)=\varnothing
$$

so

$$
(x E \triangle E) \cup(x F \triangle F)=(x(E \cup F)) \triangle(E \cup F)
$$

Write

$$
\psi=\sum_{j=1}^{n} \frac{\lambda_{j}}{m\left(E_{j}\right)} \sum_{i=1}^{j} 1_{E_{i} \backslash E_{i+1}}
$$

(with $E_{n+1}=\varnothing$ ). We thus have that

$$
\begin{aligned}
|x * \psi-\psi| & =\left|\sum_{j=1}^{n} \frac{\lambda_{j}}{m\left(E_{j}\right)} \sum_{i=1}^{j}\left(1_{x\left(E_{i} \backslash E_{i+1}\right)}-1_{E_{i} \backslash E_{i+1}}\right)\right| \\
& =\left|\sum_{i=1}^{n} \sum_{j=1}^{n} \frac{\lambda_{j}}{m\left(E_{j}\right)}\left(1_{x\left(E_{i} \backslash E_{i+1}\right)}-1_{E_{i} \backslash E_{i+1}}\right)\right| \\
& =\sum_{i=1}^{n} \sum_{j=1}^{n} \frac{\lambda_{i}}{m\left(E_{j}\right)}\left|1_{x\left(E_{i} \backslash E_{i+1}\right)}-1_{E_{i} \backslash E_{i+1}}\right| \text { (pairwise disjoint supports) } \\
& =\sum_{j=1}^{n} \frac{\lambda_{j}}{m\left(E_{j}\right)} \sum_{i=1}^{j} 1_{x\left(E_{i} \backslash E_{i+1}\right) \Delta\left(E_{i} \backslash E_{i+1}\right)} \\
& =\sum_{j=1}^{n} \frac{\lambda_{j}}{m\left(E_{j}\right)} 1_{x E_{j} \Delta E_{j}}
\end{aligned}
$$

Thus

$$
\frac{\delta \varepsilon}{m(K)}>\|x * \psi-\psi\|_{1}=\sum_{j=1}^{n} \lambda_{j} \frac{m\left(x E_{j} \triangle E_{j}\right)}{m\left(E_{j}\right)}
$$

Then we have

$$
\delta \varepsilon>\int_{K}\|x * \psi-\psi\|_{1} \mathrm{~d} x=\sum_{j=1}^{n} \lambda_{j} \int_{K} \frac{m\left(x E_{j} \triangle E_{j}\right)}{m\left(E_{j}\right)} \mathrm{d} x
$$

so at least one $\delta \varepsilon>\int_{K} \frac{m\left(x E_{j} \triangle E_{j}\right)}{m\left(E_{j}\right)} \mathrm{d} x$; we let $E=E_{j}$ for this $j$. Let

$$
N=\left\{x \in K: \frac{m(x E \triangle E)}{m(E)} \geqslant \varepsilon\right\}
$$

which is closed, and thus Borel. Then $N$ satisfies $\varepsilon 1_{N}(x) \leqslant \frac{m(x E \triangle E)}{m(E)}$, so

$$
m(N) \leqslant \frac{1}{\varepsilon} \int_{K} \frac{m(x E \triangle E)}{m(E)} \mathrm{d} x<\delta
$$

$\underline{(2) \Longrightarrow(3)}$ First note that if $G$ is discrete and $m$ is the counting measure, we could just let $\delta<1$ and be done. The hard part of the proof, then, is when $G$ is not discrete.
Let $K \subseteq G$ be compact; let $A=K \cup K^{2}$. Hence if $x \in K$ then $m(x A \cap A) \geqslant m(x K)=m(K)$. Let $0<\delta<\frac{m(K)}{2}$. If $B \subseteq A$ is Borel with $m(A \backslash B)<\delta$ then for $x \in K$ we have

$$
x A \cap A \subseteq(x B \cap B) \cup(x(A \backslash B)) \cup(A \backslash B)
$$

so

$$
2 \delta<m(K) \leqslant m(x A \cap A) \leqslant m(x B \cap B)+2 \underbrace{m(A \backslash B)}_{<\delta}
$$

Hence $0<m(x B \cap B)$. So $x B \cap B \neq \varnothing$, and $x \in B B^{-1}$. Thus $K \subseteq B B^{-1}$. Now for $\varepsilon>0$ the hypothesis gives a compact $F \subseteq G$ such that $\frac{m(x F \triangle F)}{m(F)}<\frac{\varepsilon}{2}$ for $x \in A \backslash N$ and $m(N)<\delta$. Let $B=A \backslash N$. Notice for $C, D \subseteq G$ we have $C \backslash D \subseteq(C \backslash F) \cup(F \backslash D)$; so $C \triangle D \subseteq(C \triangle F) \cup(F \triangle D)$. Thus if $x, y \in B^{-1}$ we have

$$
\begin{aligned}
m\left(x^{-1} y F \triangle F\right) & =m(x F \triangle y F) \\
& =m(x F \triangle F)+m(F \triangle y F) \\
& =m\left(F \triangle x^{-1} F\right)+m\left(y^{-1} F \triangle F\right) \\
& <\varepsilon m(F)
\end{aligned}
$$

by Equation (7). Hence for $z \in K \subseteq B B^{-1}$ we are done.
$\underline{(3) \Longrightarrow(4)}$ Straightforward. (Just like Reiter's theorem.)
$\underline{\mathbf{( 4 )} \Longrightarrow \mathbf{( 1 )}}$ If $\left(F_{\alpha}\right)$ is a Følner net, then $\left(\frac{1}{m\left(F_{\alpha}\right)} 1_{F_{\alpha}}\right)$ in $P^{1}(G)$ is a Reiter net.
Theorem 13.13
Remark 13.16. The construction of a F $\varnothing$ lner net above does not provide $F_{\alpha} \subseteq F_{\alpha^{\prime}}$ for $\alpha \leqslant \alpha^{\prime}$. This can be arranged, generally, but is technical. However, in practice, most Følner nets one encounters do satisfy this.

Fact 13.17. If $G$ is separable and amenable, then $L^{1}(G)$ is separable. If $L^{1}(G)$ is separable, then we can extract a Reiter sequence from a Reiter net. If this last holds, then Følner sequences can be found.

### 13.1 Hulanicki's theorem

Let $\lambda: G \rightarrow U\left(L^{2}(G)\right)$ be the left regular representation: $\lambda(x) h(y)=h\left(x^{-1} y\right)$ for almost every $y \in G$. Let

$$
A^{+}(G)=\left\{\left\langle h \mid \lambda^{(\mathbb{N})}(\cdot) h\right\rangle=\sum_{j=1}^{\infty}\left\langle h_{j} \mid \lambda(\cdot) h_{j}\right\rangle: h=\left(h_{j}\right)_{j=1}^{\infty} \in L^{2}(G)^{(\mathbb{N})}\right\}
$$

Note that

$$
L^{2}(G)^{(\mathbb{N})}=\left\{h=\left(h_{j}\right)_{j=1}^{\infty}: \text { each } h_{j} \in L^{2}(G), \sum_{j=1}^{\infty}\left\|h_{j}\right\|_{2}^{2}<\infty\right\}
$$

Fact 13.18. $A^{+}(G) \subseteq B^{+}(G)=\{u: G \rightarrow \mathbb{C} \mid u$ continuous, positive definite $\}$.
Notice that forh $=\left(h_{j}\right)_{j=1}^{\infty} \subseteq L^{2}(G)^{(\mathbb{N})}$ we have

$$
\left\|\left\langle h \mid \lambda^{(\mathbb{N})}(\cdot) h\right\rangle-\sum_{j=1}^{n}\left\langle h_{j} \mid \lambda(\cdot) h_{j}\right\rangle\right\|_{\infty}=\sum_{j=n+1}^{\infty}\left\|\left\langle h_{j} \mid \lambda(\cdot) h_{j}\right\rangle\right\|_{\infty}
$$

Remark 13.19.

1. If $|J|>|\mathbb{N}|$ and $h=\left(h_{j}\right)_{j \in J} \in L^{2}(G)^{(J)}$, so $\sum_{j \in J}\left\|h_{j}\right\|_{2}^{2}<\infty$, then $h_{j} \neq 0$ for at most countably many $j \in J$. Hence $\left\langle h \mid \lambda^{(J)}(\cdot) h\right\rangle \in A^{+}(G)$. (Easy check.)
2. (Eymard, 64) Each $u \in A^{+}(G)$ can be written in the form $u=\langle h \mid \lambda(\cdot) h\rangle$ for some $h \in L^{2}(G)$. (This is the standard form of von Neumann algebras.)

Theorem 13.20 (Hulanicki's theorem I). $G$ is amenable if and only if there is a net $\left(u_{\alpha}\right)$ in $A^{+}(G)$ such that $\lim u_{\alpha}=1$ uniformly on compact sets.

Proof.
$(\Longrightarrow)$ Let $\left(r_{\alpha}\right)$ in $P^{1}(G)$ be a Reiter net. Let $h_{\alpha}=r_{\alpha}^{\frac{1}{2}}$; so

$$
\|h\|_{2}=\left(\int_{G}\left|h_{\alpha}\right|^{2} \mathrm{~d} m\right)^{\frac{1}{2}}=\left(\int_{G} r_{\alpha} \mathrm{d} m\right)^{\frac{1}{2}}=1
$$

Note for $a, b \geqslant 0$ we have $|a-b|^{2} \leqslant|a-b|(a+b)=\left|a^{2}-b^{2}\right|$; so for $x \in G$ we have

$$
\begin{aligned}
\left\|\lambda(x) h_{\alpha}-h_{\alpha}\right\|_{2}^{2} & =\int_{G}\left|h_{\alpha}\left(x^{-1} y\right)-h_{\alpha}(y)\right|^{2} \mathrm{~d} y \\
& \leqslant \int_{G}\left|r_{\alpha}\left(x^{-1} y\right)-r_{\alpha}(y)\right| \mathrm{d} y \\
& =\left\|x * r_{\alpha}-r_{\alpha}\right\|_{1}
\end{aligned}
$$

Hence

$$
\begin{aligned}
\left|1-\left\langle h_{\alpha} \mid \lambda(x) h_{\alpha}\right\rangle\right| & =\left|\left\langle h_{\alpha} \mid h_{\alpha}\right\rangle-\left\langle h_{\alpha} \mid \lambda(x) h_{\alpha}\right\rangle\right| \\
& \leqslant \underbrace{\left\|h_{\alpha}\right\|_{2}}_{=1}\left\|h_{\alpha}-\lambda(x) h_{\alpha}\right\|_{2} \text { (by Cauchy-Schwarz) } \\
& =\left\|x * r_{\alpha}-r_{\alpha}\right\|_{1}^{\frac{1}{2}}
\end{aligned}
$$

and it follows that $u_{\alpha}=\left\langle h_{\alpha} \mid \lambda(\cdot) h_{\alpha}\right\rangle$ converges uniformly on compact sets to 1 .

TODO 18. Missing stuff
Corollary 13.21 (To Fell's absorption). If $u \in A^{+}(G)$ then $\langle\xi \mid \pi(\cdot) \xi\rangle u \in A^{+}(G)$. If $\pi: G \rightarrow U(\mathcal{H})$ a unitary representation then

$$
\begin{aligned}
& \mu \in M(G), \pi(\mu)=\int_{G} \pi(x) \mathrm{d} \mu(x) \\
& f \in L^{1}(G), \pi(f)=\int_{G} f(x) \pi(x) \mathrm{d} x
\end{aligned}
$$

both in the strong operator sense.
Proposition 13.22 (Choi's multiplicative domain). If $\mathcal{M} \subseteq \mathcal{B}(\mathcal{H})$ a unital $C^{*}$-algebra and $\tau \in \mathcal{B}(\mathcal{H})^{*} a$ state such that $\tau\left(A^{*} A\right)=|\tau(A)|^{2}$ for $A \in \mathcal{M}$, then

$$
\tau(A B)=\tau(A) \tau(B)=\tau(B A)
$$

for $A \in \mathcal{M}$ and $B \in \mathcal{B}(\mathcal{H})$.
Theorem 13.23 (Hulanicki's theorem II). G is amenable if and only if for any unitary representation $\pi: G \rightarrow U(\mathcal{H})$ we have $\|\pi(f)\| \leqslant\|\lambda(f)\|$ for all $f \in L^{1}(G)$. In diagram:

(where $\left.C_{\pi}^{*}=\overline{\pi\left(L^{1}(G)\right)}{ }^{\|\cdot\|} \subseteq \mathcal{B}(\mathcal{H})\right)$. We call $C_{\lambda}^{*}$ the reduced $\mathrm{C}^{*}$-algebra, sometimes denoted $C_{r}^{*}(G)$.

Proof. ( $\Longrightarrow$ ) Let $\left(u_{\alpha}\right)$ in $A^{+}(G)$ satisfy

$$
1=\lim _{\alpha} u_{\alpha}
$$

uniformly on compact sets. Since $\lambda: L^{1}(G) \rightarrow C_{\lambda}^{*}$ is injective (just as shown in the proof of Peter-Weyl) TODO 19. ref
the $\operatorname{map} \lambda(f) \mapsto \pi(f)$ is well-defined on $\lambda\left(L^{1}(G)\right.$ (non-closed subspace of $\mathcal{B}\left(L^{2}(G)\right)$ ).
Fix $f \in L^{1}(G)$ and $\varepsilon>0$; find $\xi \in \mathcal{H}$ with $\|\xi\|=1$ such that

$$
\|\pi(f)\|^{2}<\|\pi(f) \xi\|^{2}+\varepsilon
$$

For each $\alpha$ we have $v_{\alpha}=u_{\alpha}\langle\xi \mid \pi(\cdot) \xi\rangle \in A^{+}(G)$ (by Corollary 13.21), and write

$$
v_{\alpha}=\sum_{j=1}^{\infty}\left\langle h_{\alpha_{i j}} \mid \lambda(\cdot) h_{\alpha_{i j}}\right\rangle
$$

where

$$
\sum_{j=1}^{\infty}\left\|h_{\alpha_{i j}}\right\|_{2}^{2}=v_{\alpha}(e)=u_{\alpha}(e) \underbrace{\langle\xi \mid \pi(e) \xi\rangle}_{=\|\xi\|^{2}=1} \xrightarrow{\alpha} 1
$$

Then

$$
\begin{aligned}
\|\pi(f)\|^{2} & \leqslant\langle\pi(f) \xi \mid \pi(f) \xi\rangle+\varepsilon \\
& =\left\langle\xi \mid \pi\left(f^{*} * f\right) \xi\right\rangle+\varepsilon \\
& =\int_{G}\left(f^{*} * f\right)(x)\langle\xi \mid \pi(x) \xi\rangle \mathrm{d} x+\varepsilon \\
& =\lim _{\alpha} \int_{G}\left(f^{*} * f\right)(x) \underbrace{u_{\alpha}(x)\langle\xi \mid \pi(x) \xi\rangle}_{v_{\alpha}(x)} \mathrm{d} x+\varepsilon \\
& =\lim _{\alpha} \sum_{j=1}^{\infty} \int_{G}\left(f^{*} * f\right)(x)\left\langle h_{\alpha_{i j}} \mid \lambda(x) h_{\alpha_{i j}}\right\rangle \mathrm{d} x+\varepsilon(\text { LDCT }) \\
& =\lim _{\alpha} \sum_{j=1}^{\infty}\left\langle h_{\alpha_{i j}} \mid \lambda\left(f^{*} * f\right) h_{\alpha_{i j}}\right\rangle+\varepsilon \\
& =\lim _{\alpha} \sum_{j=1}^{\infty}\left\|\lambda(f) h_{\alpha_{i j}}\right\|_{2}^{2}+\varepsilon \\
& \leqslant \lim _{\alpha}\|\lambda(f)\|^{2} \sum_{j=1}^{\infty}\left\|h_{\alpha_{i j}}\right\|_{2}^{2}+\varepsilon \\
& =\|\lambda(f)\|^{2}+\varepsilon
\end{aligned}
$$

Since $\varepsilon>0$ was arbitrary, we get that $\|\pi(f)\| \leqslant\|\lambda(f)\|$.
$(\Longleftarrow)$ (Adapted from Brown and Ozawa). Let $\sigma: G \rightarrow \mathbb{T}=U(\mathbb{C})$ be the trivial character. Then the integrated forms are as follows:

- $\sigma: M(G) \rightarrow \mathcal{B}(\mathbb{C})=\mathbb{C}$ given by

$$
\sigma(\mu)=\int_{G} 1 \mathrm{~d} \mu(x)=\mu(G)
$$

- $\sigma: L^{1}(G) \rightarrow \mathcal{B}(\mathbb{C})=\mathbb{C}$ given by

$$
\sigma(f)=\int_{G} f(x) \mathrm{d} x
$$

(sometimes called the augmentation character).

Notice that $\sigma\left(\mu^{*}\right)=\overline{\mu\left(G^{-1}\right)}=\overline{\sigma(\mu)}$, so $\sigma\left(f^{*}\right)=\overline{\sigma(f)}$ for $f \in L^{1}(G)$; so $\sigma$ is a *-homomorphism. By assumption we have $|\sigma(f)| \leqslant\|\lambda(f)\|$ for $f \in L^{1}(G)$.
If $\mu \in M(G)$ and $f \in P^{1}(G)$ satisfies $\sigma(f)=1$, we have $\sigma(\mu * f)=\sigma(\mu) \sigma(f)=\sigma(\mu)$. So

$$
|\sigma(\mu)|=|\sigma(\mu * f)| \leqslant\|\lambda(\mu * f)\| \leqslant\|\lambda(\mu)\| \underbrace{\|\lambda(f)\|}_{\leqslant\|f\|_{1}=1} \leqslant\|\lambda(\mu)\|
$$

i.e. $|\sigma(\mu)| \leqslant\|\lambda(\mu)\|$. Hence it follows that $\sigma$ extends to a functional, again called $\sigma$, on $M_{\lambda}^{*}=\overline{\lambda(M(G))}\|\cdot\|$. Then $\sigma(I))=\sigma\left(\delta_{e}\right)=1$, and

$$
\sigma\left(\lambda(\mu)^{*} \lambda(\mu)\right)=\sigma\left(\lambda\left(\mu^{*} * \mu\right)\right)=\sigma\left(\mu^{*} * \mu\right)=\overline{\sigma(\mu)} \sigma(\mu) \geqslant 0
$$

and it follows that $\sigma$ is a state on $M_{\lambda}^{*}$. (Note that this also implies that $\sigma\left(A^{*} A\right)=(\sigma(A))^{2}$ for $A \in M_{\lambda}^{*}$.) Let $\tau \in \mathcal{B}\left(L^{2}(G)\right)^{*}$ be any norm-preserving extension of $\sigma$; i.e. $\tau \upharpoonright M_{\lambda}^{*}=\sigma$. We have (by the black box) that $\tau$ is a state on $\mathcal{B}\left(L^{2}(G)\right)$.
Let $M: L^{\infty}(G) \rightarrow \mathcal{B}\left(L^{2}(G)\right)$ be $M(\varphi) f=\varphi f m$-almost-everywhere (representation of $L^{\infty}(G)$ as multiplication operators). Then $M(\bar{\varphi})=M(\varphi)^{*}$ and $M(\varphi \psi)=M(\varphi) M(\psi)$. We compute for $x \in G$, almost every $y \in G$, and $h \in L^{2}(G)$

$$
\lambda(x) M(\varphi) \lambda(x)^{*} h(y)=\lambda(x) M(\varphi)(y \mapsto h(x y))=\lambda(x)(y \mapsto \varphi(y) h(x y))=\varphi\left(x^{-1} y\right) h(y)
$$

Hence $\lambda(x) M(\varphi) \lambda(x)^{*}=M\left(\varphi \cdot x^{-1}\right)$. By Choi's multiplicative domain technique, we see that (since $\tau\left(A^{*} A\right)=\sigma\left(A^{*} A\right)=|\sigma(A)|^{2}=|\tau(A)|^{2}$, for $\left.A \in M_{\lambda}^{*}\right)$

$$
(\tau \circ M)(\varphi \cdot x)=\tau\left(\lambda\left(\delta_{x^{-1}}\right) M(\varphi) \lambda\left(\delta_{x}\right)\right)=\tau\left(\lambda\left(\delta_{x^{-1}}\right)\right)(\tau \circ M)(\varphi) \tau\left(\lambda\left(\delta_{x}\right)\right)=(\tau \circ M)(\varphi)
$$

since

$$
\tau\left(\lambda\left(\delta_{x}\right)\right)=\sigma\left(\delta_{x}\right)=\int_{G} 1 \mathrm{~d} \delta_{x}=1
$$

Also if $\varphi \geqslant 0$ then

$$
(\tau \circ M)(\varphi)=(\tau \circ M)\left(\overline{\varphi^{\frac{1}{2}}} \varphi^{\frac{1}{2}}\right)=\tau\left(M\left(\varphi^{\frac{1}{2}}\right)^{*} M\left(\varphi^{\frac{1}{2}}\right)\right) \geqslant 0
$$

and $(\tau \circ M)(1)=1$. So $\tau \circ M \in \mathcal{M} L^{\infty}(G)$ is left-invariant.

### 13.2 A final fact about amenability: closed subgrapes

Consider the grape ring

$$
\mathbb{C}[G]=\left\{\sum_{i=1}^{n} \alpha_{i} x_{i}: \alpha_{1}, \ldots, \alpha_{n} \in \mathbb{C}, x_{1}, \ldots, x_{n} \in G\right\}
$$

Suppose

$$
\begin{aligned}
S & =\sum_{i=1}^{n} \alpha_{i} x_{i} \\
T & =\sum_{j=1}^{m} \beta_{j} y_{j}
\end{aligned}
$$

are elements of $\mathbb{C}[G]$. We define the multiplication

$$
S T=\sum_{i=1}^{n} \sum_{j=1}^{m} \alpha_{i} \beta_{j} x_{i} y_{j}
$$

and the involution

$$
S^{*}=\sum_{i=1}^{n} \overline{\alpha_{i}} x_{i}^{-1}
$$

$$
S^{*} S=\sum_{i=1}^{n} \sum_{j=1}^{n} \overline{\alpha_{i}} \alpha_{j} x_{i}^{-1} x_{j}
$$

We define a pairing: for $u \in C_{b}(G)$ and $S \in \mathbb{C}[G]$ we set

$$
\langle u, S\rangle=\sum_{i=1}^{n} \alpha_{i} u\left(x_{i}\right)
$$

Fact 13.24. For $u \in C_{b}(G)$ we have $u \in B^{+}(G)$ if and only if $\left\langle u, S^{*} S\right\rangle \geqslant 0$ for any $S \in \mathbb{C}[G]$.
We define a partial order on $B^{+}(G)$ : for $u, v \in B^{+}(G)$ we say $u \leq v$ if and only if $\left\langle u, S^{*} S\right\rangle \leqslant\left\langle v, S^{*} S\right\rangle$ for all $S \in \mathbb{C}[G]$; i.e. if and only if $v-u \in B^{+}(G)$.

Lemma 13.25. Suppose $\pi: G \rightarrow U(\mathcal{H})$ is a unitary representation.

1. If $u \in B^{+}(G)$ and $u \leq\langle\xi \mid \pi(\cdot) \xi\rangle$ for some $\xi \in \mathcal{H}$ then there is $\eta \in \mathcal{H}$ such that $u=\langle\eta \mid \pi(\cdot) \eta\rangle$.
2. If $u=\langle\eta \mid \pi(\cdot) \eta\rangle \in B^{+}(G)$ for some $\xi, \eta \in \mathcal{H}$, then there is $\zeta \in \mathcal{H}$ such that $u=\langle\zeta \mid \pi(\cdot) \zeta\rangle$.

Proof.

1. We observe that

- $\pi$ extends to a $*$-homomorphism $\pi: \mathbb{C}[G] \rightarrow \mathcal{B}(\mathcal{H})$ by

$$
\pi\left(\sum_{i=1}^{n} \alpha_{i} x_{i}\right)=\sum_{i=1}^{n} \alpha_{i} \pi\left(x_{i}\right)
$$

and $\pi\left(S^{*}\right)=\pi(S)^{*}$.

- The map $\mathbb{C}[G] \rightarrow \mathcal{H}$ given by $S \mapsto \pi(S) \xi$ is linear.

We let $\mathcal{L}_{0}=\pi(\mathbb{C}[G]) \xi$ (the image of this second map); we let $\mathcal{L}=\overline{\mathcal{L}_{0}}$ (norm closure). For $(S, T) \in$ $\mathbb{C}[G] \times \mathbb{C}[G]$ we let

$$
[S \mid T]_{u}=\left\langle u, S^{*} T\right\rangle
$$

Then $[\cdot \mid \cdot]_{u}: \mathbb{C}[G] \times \mathbb{C}[G] \rightarrow \mathbb{C}$ is sesquilinear and positive $[S \mid S]_{u}=\left\langle u, S^{*} S\right\rangle \geqslant 0$ for $S \in \mathbb{C}[G]$. Hence Cauchy-Schwarz inequality applies, and we have

$$
\begin{aligned}
\left|[S \mid T]_{u}\right| & \leqslant[S \mid S]_{u}^{\frac{1}{2}}[T \mid T]_{u}^{\frac{1}{2}} \\
& \leqslant\left\langle u, S^{*} S\right\rangle^{\frac{1}{2}}\left\langle u, T^{*} T\right\rangle^{\frac{1}{2}} \\
& \leqslant\left\langle\xi \mid \pi\left(S^{*} S\right)\right\rangle^{\frac{1}{2}}\left\langle\xi \mid \pi\left(T^{*} T\right)\right\rangle^{\frac{1}{2}} \text { (by assumption) } \\
& =\|\pi(S) \xi\|\|\pi(T) \xi\|
\end{aligned}
$$

Hence $[\cdot \mid \cdot]_{u}$ extends to a bounded sesquilinear form $[\cdot \mid \cdot]_{u}$ on $\mathcal{L} \times \mathcal{L}$. Notice on $\mathcal{L}_{0} \times \mathcal{L}_{0}$ we have $[\pi(S) \xi \mid \pi(T) \xi]_{u}=\left\langle u, S^{*} T\right\rangle$ and $[\pi(S) \xi \mid \pi(S) \xi]_{u}=\left\langle u, S^{*} S\right\rangle \geqslant 0$, so this is a positive form. So the Riesz representation theorem for Hilbert spaces provides $A \in \mathcal{B}(\mathcal{L})$ such that

$$
[S \mid T]_{u}=[\pi(S) \xi \mid \pi(T) \xi]_{u}=\langle\pi(S) \xi \mid A \pi(T) \xi\rangle
$$

Notice also that $\langle\pi(S) \xi \mid A \pi(S) \xi\rangle \geqslant 0$; so $A$ is positive on $\mathcal{L}$. Also for $x \in G$ we have

$$
[x S \mid x T]_{u}=\left\langle u, S^{*} x^{-1} x T\right\rangle=\left\langle u, S^{*} T\right\rangle=[S \mid T]_{u}
$$

so $\langle\pi(x) \pi(S) \xi \mid A \pi(x) \pi(T) \xi\rangle=\langle\pi(S) \xi \mid A \pi(T) \xi\rangle$, and hence $\pi(x)^{*} A \pi(x)=A$ on $\mathcal{L}_{0}$, and hence on $\mathcal{L}$. So $A \pi(x)=\pi(x) A$. We use black box the second to get $A^{\frac{1}{2}}$ which satisfies $\pi(x) A^{\frac{1}{2}}=A^{\frac{1}{2}} \pi(x)$ for $x \in G$. We then let $\eta=A^{\frac{1}{2}} \xi$.
2. We use polar decomposition: for $S \in \mathbb{C}[G]$ we have

$$
\begin{aligned}
0 & \leqslant\left\langle\xi \mid \pi\left(S^{*} S\right) \eta\right\rangle \\
& =\frac{1}{4} \sum_{k=0}^{3} i^{k} \underbrace{\left\langle\xi+i^{k} \eta \mid \pi\left(S^{*} S\right)\left(\xi+i^{k} \eta\right)\right\rangle}_{\geqslant 0} \\
& =\frac{1}{4}\left(\left\langle\xi+\eta \mid \pi\left(S^{*} S\right)(\xi+\eta)\right\rangle-\left\langle\xi-\eta \mid \pi\left(S^{*} S\right)(\xi-\eta)\right\rangle\right. \\
& \leqslant\left\langle\frac{1}{2}(\xi+\eta) \left\lvert\, \pi\left(S^{*} S\right) \frac{1}{2}(\xi+\eta)\right.\right\rangle
\end{aligned}
$$

so $\langle\xi \mid \pi(\cdot) \eta\rangle \leq\left\langle\left.\frac{1}{2}(\xi+\eta) \right\rvert\, \pi(\cdot)(\xi+\eta)\right\rangle$. We then appeal to the first item to get our $\zeta$. $\square$ Lemma 13.25
Corollary 13.26. $B^{+} \cap C_{c}(G)$ is contained in $A^{2}(G)$ and is a dense subset.
Proof. Suppose $u \in B^{+} \cap C_{c}(G)$. Let $K=\operatorname{supp}(u)$. Let $U$ be a relatively compact neighbourhood of $e$, and let

$$
v=\frac{1}{m(U)}\left\langle 1_{K U} \mid \lambda(\cdot) 1_{U}\right\rangle
$$

(matrix coefficient of $\lambda$ ). So

$$
v(x)=\frac{1}{m(U)} \int_{G} 1_{K U}(y) 1_{x U}(y) \mathrm{d} y=\frac{m(K U \cap x U)}{m(U)}
$$

so $v \upharpoonright K=1$. Hence we write $u=\langle\xi \mid \pi(\cdot) \xi\rangle$ (appealing to Adam's talk) and

$$
u=u v=\frac{1}{m(U)}\left\langle\xi \otimes 1_{K U} \mid(\pi \otimes \lambda)(\cdot) \xi \otimes 1_{U}\right\rangle=\left\langle\omega^{\prime} \mid \lambda^{(J)}(\cdot) \omega\right\rangle
$$

for some $\omega^{\prime}, \omega \in L^{2}(G)^{(J)}$ (and we have used Fell's absorption principle). By the lemma
TODO 20. ref
we write $u=\left\langle\zeta \mid \lambda^{(J)}(\cdot) \zeta\right\rangle \in A^{+}(G)$. Furthermore, if

$$
u=\sum_{j=1}^{\infty}\left\langle h_{j} \mid \lambda(\cdot) h_{j}\right\rangle
$$

we can approximate by

$$
u_{n}=\sum_{j=1}^{n}\left\langle h_{j} \mid \lambda(\cdot) h_{j}\right\rangle
$$

and each $h_{1}, \ldots, h_{n}$ can be $L^{2}$-approximated by $f_{1}, \ldots, f_{n} \in_{c}(G)$. One checks that $u$ can be uniformly approximated by

$$
\sum_{j=1}^{n}\left\langle f_{j} \mid \lambda(\cdot) f_{j}\right\rangle \in B^{+} \cap C_{c}(G)
$$

Corollary 13.26
Corollary 13.27 (Hulanicki I'). $G$ is amenable if and only if there is a net $\left(u_{\alpha}\right)$ in $B^{+} \cap C_{c}(G)$ such that

$$
1=\lim _{\alpha} u_{\alpha}
$$

uniformly on compact sets.
Corollary 13.28. If $G$ is amenable and $H$ is a closed subgrape then $H$ is amenable.
Proof. Let $\left(u_{\alpha}\right)$ in $B^{+} \cap C_{c}(G)$ be as in Hulanicki I' above. Then each $u_{\alpha} \upharpoonright H \in B^{+} \cap C_{c}(H)$ (as $H$ is closed), and the net $\left(u_{\alpha} \upharpoonright H\right)$ in $B^{+} \cap C_{c}(H)$ shows that $H$ is amenable. Corollary 13.28
